**Single Cylinder – Four Cycle**

**MODELS**

**ACN, BKN**

**AENL and AGND**

**WORLD'S LARGEST BUILDERS OF HEAVY DUTY AIR COOLED ENGINES**

# NEW ENGINE Instructions

READ THOROUGHLY BEFORE STARTING ENGINE.

## 1. LUBRICATION – Operating without oil will ruin engine.

### IMPORTANT

There is **NO OIL** in this unit.  
Fill crankcase to proper oil level, also clutch or gear box if either accessory is furnished.

Refer to *GRADE OF OIL* chart and fill with proper oil *before* starting engine.

## 2. AIR CLEANER

Must be cleaned regularly – very frequently in dusty and dry grass conditions.  
*Damage will result from operating with dirty air cleaner.*

Dry element type, standard equipment on Models TRA-12D and S-14D.

Oil bath type requires same grade oil as used in crankcase. Maintain oil level or dirt will be drawn in and damage engine.

## 3. FUEL – USE 'REGULAR' GRADE GASOLINE.

Engines built to operate on FUEL OIL, KEROSENE, L.P.G. or NATURAL GAS are so identified in the model designation. Refer to 'FUEL' paragraphs of instructions.  
Buy fresh fuel. Do not use *out-of-season* gasoline.

## 4. NEGATIVE GROUND CIRCUIT

, if engine is electrically equipped with BATTERY IGNITION, MOTOR-GENERATOR or FLYWHEEL ALTERNATOR.

**GROUND ENGINE TO NEGATIVE TERMINAL ON BATTERY.**

*CAUTION:* Be absolutely sure of proper connection or damage to coil, points and regulator will result.

## 5. REWIND STARTER – OPTIONAL STARTING EQUIPMENT.

### INSTRUCTIONS FOR STARTING

Pull engine over against compression. Let rope rewind into starter slowly. Pull firmly and rapidly to start engine. (Repeat procedure if necessary). **DO NOT DROP ROPE ASSEMBLY**, hold on to handle while rewinding. *Rope may rewind improperly and jam assembly.*

## 6. TEMPERATURE SAFETY SWITCH

Do not disconnect wire or allow terminal to touch head fins or shrouding.

Optional accessory mounted to cylinder head bolt near spark plug – *TO PROTECT ENGINE AGAINST OVERHEATING*. If engine is equipped with this switch and stops, check first to see if engine is overheated. Other conditions may have caused engine to stop. Clean air cleaner, air intake screen, fins and check oil level, spark plugs and wiring. Let engine cool at least 10 minutes before re-starting.

## KEEP ENGINE CLEAN

External dirt restricts cooling and internal dirt causes wear – the result will be costly repairs.

### PREVENT OVERHEATING

**AIR CLEANER**  
Service daily if necessary.

**AIR INTAKE**  
Remove screen and brush clean.

# WISCONSIN Single Cylinder Engine Models ACN, BKN, AENL, AGND

Engines having Stellite Exhaust Valve and Seat Insert are designated as Models ACND, BKND and AENLD.

## OPERATING NEW ENGINE

Proper breaking-in of a new engine will greatly increase its life and result in trouble-free operation. The factory test given to a new engine is not sufficient to establish the polished bearing surfaces, which are so necessary for the proper performance and long life of an engine. There is no quick way to force the establishment of good bearing surfaces, and these can only be obtained by running a new engine carefully and under reduced speeds and loads for a short period of time.

Run the engine for an hour without load, at 1600 to 1800 R.P.M. The speed should then be increased gradually, to engine operating speed, still without load, for an additional two hours. If at all possible, operate the engine at light loads for a period totaling about eight hours, before maximum load is applied.

The various bearing surfaces in a new engine have not been glazed, as they will be with continued operation, and it is in this period of "running in," that special care must be exercised, otherwise the highly desired glaze will never be obtained.

## SPECIFICATIONS and HORSEPOWER

MODEL	ACN	BKN	AENL	AGND
Bore (inches)	2-5/8	2-7/8	3	3-1/2
Stroke (inches)	2-3/4	2-3/4	3-1/4	4
Displ. (cu. in.)	14.9	17.8	23.0	38.5
R.P.M.	HORSEPOWER			
2000	3.5	4.4	6.1	10.2
2200	3.7	4.9	6.8	10.9
2400	4.2	5.4	7.4	11.5
2600	4.5	5.8	7.9	11.9
2800	4.8	6.2	8.5	12.2
3000	5.2	6.5	8.9	12.4
3200	5.6	6.7	9.2	12.5
3400	5.8	6.9	9.2	-
3600	6.0	7.0	9.2	-

Horsepower specified in the accompanying chart is for an atmospheric temperature of 60° Fahrenheit at sea level and at a Barometric pressure of 29.92 inches of mercury.

The friction in new engines cannot be reduced to the ultimate minimum during the regular block test, but engines are guaranteed to develop at least 85% of maximum power when shipped from the factory. Power will increase, as friction is reduced, after a few days of operation. The engine will develop at least 95% of power when friction is reduced to a minimum. For continuous operation, allow 20% of horsepower as a safety factor.

## ROTATION

The rotation of the crankshaft is clockwise when viewing the flywheel or cranking end of the engine. This gives counter-clockwise rotation when viewing the power take-off end of the engine. The flywheel end of the engine is designated the front end, and the power take-off end, the rear end of the engine.

**CAUTION: OIL AND FUEL HAVE BEEN DRAINED FROM THIS ENGINE FOR SHIPPING AND STORAGE PURPOSES. PREPARE ENGINE AS FOLLOWS, BEFORE STARTING.**

## LUBRICATION

THERE IS NO OIL IN THIS UNIT. Fill crankcase, clutch and gear box (if furnished), to level marks indicated, with oil classified as Service MS and per viscosity grades in oil chart.

### GRADE OF OIL CHART

SEASON or TEMPERATURE	GRADE OF OIL	EXAMPLE		
Spring, Summer or Autumn + 120°F to + 40°F	SAE 30	Mobiloil A		
Winter + 40°F to + 15°F + 15°F to 0°F Below Zero	SAE 20-20W SAE 10W SAE 5W-20	Mobiloil Arctic Mobiloil 10W Mobiloil 5W-20		
Use oils classified as Service MS				
Engine Model	Crankcase Capacity	Clutch Unit	Reduction Unit	Cl. Red. Unit
ACN, BKN	2 Pts.	1/2 Pt.	1 Pt.	-
AENL	3 Pts.	1 Pt.	2/3 Pt.	1 Pt.
AGND	7 Pts.	3/4 Pt.	1 1/2 Pts.	1 Qt.

MODELS ACN, BKN, AGND

MODEL AENL

Fig. 1, LUBRICATION SYSTEMS

1. Oil filler and level plug
2. Oil drain plug
3. Oil pump - maintains level in trough for splash system
4. Oil Pump - directs oil spray against connecting rod

Fig. 2, USE SAME GRADE OIL IN THESE UNITS AS USED IN CRANKCASE - CHANGE EVERY 500 HOURS OF OPERATION

The crankcase capacity, specified in the 'GRADE OF OIL CHART' should be maintained at the level of the oil filler plug opening, Ref. 1 of Figures 1 and 3.

For run-in of new engines, use same oil as recommended in GRADE OF OIL CHART.

CHECK CRANKCASE OIL LEVEL EVERY 8 HOURS. CHANGE OIL EVERY 50 HOURS OF OPERATION.

### AIR CLEANER

Add oil to level line indicated on bowl of OIL BATH AIR CLEANER, Fig. 3, Ref. 3. Use same grade oil as used in crankcase.

DRY ELEMENT AIR CLEANER, is available upon request in place of oil bath cleaner - do not oil element - do not use gasoline, kerosene or solvent for cleaning.

Refer to DECAL on air cleaner body for specific maintenance instructions.

### FUEL

Regular grade gasoline.

OIL BURNING engine has letter 'O' suffixed to model designation - use 35 minimum octane fuel oil.

L.P.G. BURNING engine has letter 'G' added to model designation - use propane HD5.

NATURAL GAS burning engines require a B.T.U. content of at least 1000.

## IGNITION

### MAGNETO

The spark for ignition is furnished by a high tension magneto driven off the timing gears at crankshaft speed. An impulse coupling makes possible a powerful retarded spark for easy starting with no dangerous kick-back. Magneto timing on Page 3.

### BATTERY IGNITION-12 Volt Neg. Ground

When electric starter and generator or fly-wheel alternator are furnished battery ignition is used. Connect ground cable from negative terminal of battery to lug on starting motor. Timing on Page 4.

## STARTING

### STARTING PROCEDURE

- Check crankcase oil level and gasoline supply. Open fuel shut-off valve. OIL BURNING engines must be started on gasoline and run for 2 or 3 minutes before switching to oil. Special instructions are furnished for starting L.P.G. and NATURAL GAS burning engines.
- The HIGH SPEED NEEDLE VALVE on carburetor is adjusted when engine is tested. See 'CARBURETOR - ADJUSTMENT' for further information.
- Disengage clutch, if furnished.
- Set throttle about 1/2 open if variable speed governor control is furnished.

Fig. 4

- Close choke on carburetor, see Fig. 5, and crank engine over slowly one complete turn. Open choke half-way, turn engine over to compression stroke and then back off 1/2 turn. Wind rope fully on sheave and PULL BRISKLY to turn crankshaft over. See Fig. 4.

Hand crank starting is accomplished by engaging the crank and pulling up briskly in a clockwise rotation. DO NOT attempt to spin the engine with the starting crank. If the engine does not start on the first attempt, re-engage the crank and repeat the operation.

With STARTING MOTOR, pull out ignition switch, (tag reads 'TO STOP PUSH IN'), and depress starter button.

- After engine starts OPEN CHOKE FULLY. Less choking is necessary in warm weather or when engine is warm, than when cold. Should flooding occur, open choke fully and continue cranking.

If all conditions are right, engine will start promptly in one or two attempts. After engine starts, allow it to warm up a few minutes before applying load. Do not race or gun engine to hurry WARM-UP, as the proper oil film on various surfaces of the piston, cylinder, bearings, etc., cannot be established until the oil has warmed up and become sufficiently fluid.

Break-in new engine per instructions on front page of this manual.

### TO STOP ENGINE

Magneto ignition engines have a lever type ground switch on the side of the magneto. DEPRESS AND HOLD DOWN UNTIL ENGINE STOPS. See Fig. 3, Ref. 10. Engines with motor-generator or battery ignition have an ignition switch on control panel 'TO STOP PUSH IN'.

If engine has been running hard and is hot, do not stop it abruptly from full load. Cool the engine by removing the load and allowing the engine to run idle (1000 to 1200 R.P.M.), for 3 to 5 minutes.

### CARBURETOR - ADJUSTMENT, Fig. 5

The carburetor HIGH SPEED NEEDLE VALVE should be opened approximately 1/4 turns from its seat. After the engine is started and warmed up, adjust the needle valve for best operation under full load. In cold weather, starting may be facilitated by opening the needle valve slightly more, then readjusted to normal running position after engine is started.

Fig. 3, ENGINE REFERENCE VIEWS

- |                              |                                       |                                     |

MARVEL-SCHEBLER for ACN, BKN

ZENITH for ACN, BKN

ZENITH for AENL, AGND

Fig. 5, CARBURETOR ADJUSTMENTS

The correct amount of throttle plate opening for low idle speed is obtained by means of the THROTTLE STOP SCREW. However, since this is set at the factory no immediate readjustment is necessary. The IDLE ADJUSTMENT is for smooth low speed operation and must be made with the carburetor throttle lever closed.

**SPARK PLUG, Fig. 6**

The spark plug gap should be 0.030 of an inch and plug should be kept clean both inside and out. Check spark plug gap with a wire type gauge and regap as shown.

Replacement plug must be of the correct heat range, like Champion No. D-16J or AC No. C86 com. Thread size is 18mm.

TORQUE spark plug 28 to 30 FOOT POUNDS. If torque wrench is not available, tighten plug until it begins to seat on the gasket, then turn 1/2 to 3/4 of a turn more.

**MAGNETO**

**BREAKER POINT ADJUSTMENT, Fig. 7**

At least once each season or when ignition spark becomes weak, remove magneto end cover, inspect points and check gap opening. If there is evidence of pitting or pyramiding and it becomes necessary to resurface or replace points, it will be necessary to readjust gap to its proper clearance. The BREAKER POINT GAP should be 0.015

Fig. 6

inch at full separation. Turn engine crankshaft over until breaker points are at their maximum opening. Loosen the two lock-screws on breaker plate just enough so that plate can be moved. Place a 0.015 inch feeler gauge between points. Insert end of small screw driver into adjusting slot at bottom of breaker plate and open or close the contacts by moving plate until proper point gap is obtained. After tightening lock-screws, recheck breaker point gap.

Fig. 7

**MAGNETO TIMING**

Proper mounting of the magneto is essential for correct timing. If magneto was taken off for any reason, it can be reassembled as follows: Remove spark plug and determine compression stroke by placing finger over spark plug hole while cranking engine by hand. Upon reaching compression stroke continue cranking until leading edge of the 'D-C' and 'X' marked vane on flywheel, is in line with the vertical centerline mark on flywheel shroud, as shown in Fig. 8. Leave flywheel in this position. At this point, piston is on top dead center and flywheel keyway is up.

Fig. 8

- 1. Marked Flywheel Vane
- 2. Vertical Centerline Mark
- 3. Advance Mark, for Timing Light Check.
- 4. Running Spark Advance.

Fig. 9, ACN, BKN TIMING

- 1. Vertical Centerline Mark
- 2. Inspection Hole
- 3. Timing Marks on Mag. and Cam. Gears
- 4. Spark Advance Timing Mark
- 5. 17° Running Spark Advance

**MODELS ACN, BKN, Fig. 9**

Mount magneto so that the timing mark on face of magneto gear matches up with mark on camshaft gear as seen thru inspection hole in crankcase.

**MODEL AENL, Fig. 10**

Mount magneto to engine, meshing the gears so that when the magneto is in place, the 'X' marked tooth on the magneto gear will be visible in the center of the inspection hole of the crankcase.

**MODEL AGND, Fig. 11**

Remove plug from crankcase at take-off end. The timing mark between two camshaft gear teeth will be visible thru this opening. Mount magneto so that the 'O' marked tooth on the face of magneto gear matches up with the 'I' mark on face of camshaft gear, as seen thru inspection hole.

**ALL MODELS**

When magneto is properly timed, the impulse coupling will snap when the 'DC' marked vane of flywheel, lines up with the vertical centerline mark on flywheel shroud, while turning engine over slowly. The running spark advance for checking with a timing light is 17° for Models ACN, BKN and 20° for Models AENL and AGND.

Fig. 10, AENL MAGNETO TIMING

Fig. 11, AGND MAGNETO TIMING

Fig. 12, IGNITION TIMER MOUNTING

## BATTERY IGNITION

**TIMING, Fig. 8 and Fig. 12**

Ignition timer is used in place of magneto when electric starter and generator or flywheel alternator is furnished.

The breaker point gap of 0.020 inch should be checked and adjusted before timer body is set and locked in place. Any change in gap opening will affect the ignition advance. To adjust gap, loosen contact locknut and screw fixed contact in or out.

Turn engine over until 'DC' and 'X' marked flywheel vane are in line with vertical centerline mark on shroud, and with piston on compression stroke, as per Fig. 8 and 'MAGNETO TIMING' paragraph.

Assuming the timer assembly is removed from the engine, turn cam, by means of drive gear, in a counter-clockwise direction (Models ACN, BKN, AENL), clockwise (Model AGND), until breaker points are just beginning to open. Mount timer assembly to engine, as illustrated in Fig. 12.

Since the running spark advance of the engine is 17° (ACN, BKN), 20° (AENL, AGND), and the timer automatic advance is 15°, an initial advance setting of 2° (ACN, BKN), 5° (AENL, AGND) must be obtained and in the following manner: With the clamp lever screw loose and breaker points just beginning to open, turn timer body: -

### MODEL ACN, BKN

Clockwise through an angle of 2° or 3/64 inch on the outside circumference of timer.

### MODEL AENL

Clockwise, 5° or about 1/8 inch in circumference of timer body.

### MODEL AGND

Counter-clockwise direction 5° or about 1/8 inch in circumference of timer body.

Tighten clamp screw, mount timer cover and connect primary wire from ignition timer to coil. If care is exercised in the preceding instructions, the spark timing should be accurate enough for satisfactory starting, however, checking spark advance with a timing light is highly recommended. Refer to Fig. 8 for spark advance marks.

The ignition timer oiler and cam felt wick should have 3 to 5 drops of medium engine oil every 100 hours of operation.

## ELECTRICAL WIRING Fig. 13, 14

The standard wiring circuits for all 12 volt electrical equipment is negative ground polarity. Engines can be furnished with start-

er and generator or combination motor-generator. Flywheel alternator is available on Models AENL and AGND.

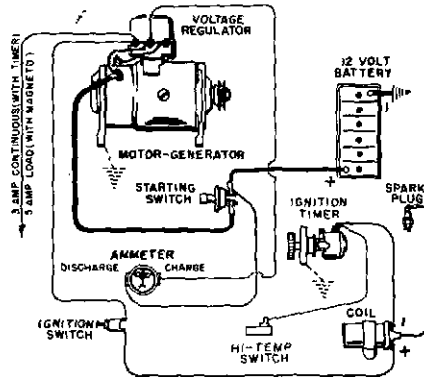

Fig. 13, MOTOR-GENERATOR WIRING

## FLYWHEEL ALTERNATOR

12 Volt - 10 Amp or 30 Amp NEGATIVE GROUND Alternator, consisting of a flywheel with Magnetic Rotor, Stator and Rectifier-Regulator module, is optional equipment on models AENL and AGND.

The flywheel alternator is of the permanent magnet type and has no brushes, commutator or belts and requires no adjustments.

PRECAUTIONS to be exercised in the use of a flywheel alternator:

1. Do not reverse battery connections. This is a negative ground system only.
2. Connect booster batteries - positive to positive and negative to negative.
3. Do not polarize the alternator.
4. Do not ground any wires from stator or modules which terminate at connectors.

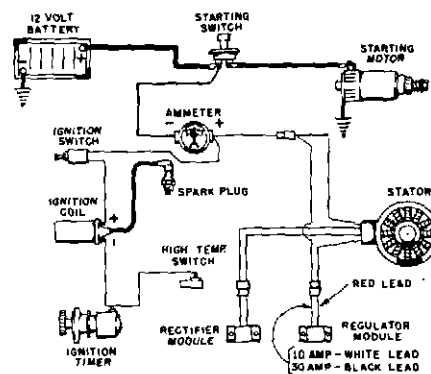

Fig. 14, FLYWHEEL ALTERNATOR

5. Do not operate engine with battery disconnected from system.

6. Disconnect at least one battery lead if a fast battery charger is used.

7. Never use a fast charger to boost battery output.

## CLUTCH ADJUSTMENT

If the clutch begins to slip, it should be readjusted to prevent it from becoming overheated and damaged. First, remove inspection plate to expose the adjusting ring. Release clutch by pushing shifter lever forward (toward engine). Refer to name plate on clutch housing to identify whether it is a TWIN DISC or ROCKFORD CLUTCH, for proper adjustment procedure.

### TWIN DISC CLUTCH, Fig. 15

Turn take-off shaft by hand until SET SCREW in the ADJUSTING RING is on top. Loosen set screw, and with a drift punch turn ring in a clockwise direction 1/4 turn at a time. The take-off shaft must be held stationary. After each movement of the ring, engage clutch. When properly adjusted, clutch will engage with a slight snap.

### ROCKFORD CLUTCH, Fig. 16

Turn engine over until clutch ADJUSTMENT LOCK is visible thru the inspection opening. Loosen ADJUSTMENT LOCKSCREW, thru PIPE PLUG HOLE, one full turn. Keep clutch from turning by holding rope sheave firmly in place. Turn ADJUSTING RING one notch at a time in a clockwise direction, until a very firm pressure is felt when operating the clutch with shifter lever, as it snaps into engaged position. Securely tighten ADJUSTMENT LOCKSCREW.

### CLUTCH REDUCTION UNITS

The clutch in the clutch reduction unit is the same as used in the power take-off unit and is adjusted in the same manner.

Fig. 15, TWIN DISC CLUTCH

Fig. 16, ROCKFORD CLUTCH

# ENGINE WARRANTY

WISCONSIN MOTOR, hereinafter referred to as "Manufacturer", warrants each new engine sold by the Manufacturer to be free from defects in material and workmanship, under normal use and service, for a period of one (1) year after the date of delivery to the original retail purchaser, and Manufacturer will, at its option, replace or repair, at one of the Manufacturer's factories, or at a point designated by the Manufacturer, any part or parts which shall appear to the satisfaction of the Manufacturer upon inspection at such point, to have been defective in material or workmanship. This Warranty does not obligate the Manufacturer to bear any transportation charges in connection with the replacement or repair of defective parts.

This Warranty shall not apply to any engine which shall have been installed or operated in a manner not recommended by the Manufacturer; nor to any engine which shall have been repaired, altered, neglected or used in any way which, in the Manufacturer's opinion, adversely affects its performance; nor to any engine in which parts not manufactured by the Manufacturer, or supplied by the Manufacturer or by one of Manufacturer's Distributors or approved Service Centers, have been used; nor to any accessories installed on the engine, where the accessory manufacturer has its own warranty; nor to normal maintenance services or replacement of normal service items.

Manufacturer reserves the right to modify, alter, and improve any engine or parts without incurring any obligation to replace any engine or parts previously sold with such modified, altered or improved engine or part.

THIS WARRANTY, AND THE MANUFACTURER'S OBLIGATION THEREUNDER, IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESS, IMPLIED, OR STATUTORY, INCLUDING ANY WARRANTIES OF MERCHANTABILITY OR OF FITNESS FOR A PARTICULAR PURPOSE, and all other obligations or liabilities, including special or consequential damages or contingent liabilities arising out of the failure of any engine or part to operate properly. No person is authorized to give any other warranty or to assume any additional obligation on the Manufacturer's behalf unless made in writing and signed by an officer of the Manufacturer.

THIS MANUAL IS FOR MY WISCONSIN MODEL..... ENGINE

SPEC. No..... SERIAL No.....

THE ABOVE INFORMATION, WHICH WILL BE FOUND ON THE NAME PLATE ATTACHED TO THE AIR SHROUD OF THE ENGINE, SHOULD BE FILLED IN. YOUR PROMPT ATTENTION TO THIS MATTER WILL MAKE IT CONVENIENT FOR YOU IN THE FUTURE, AS THIS INFORMATION MUST BE GIVEN WHEN ORDERING SERVICE REPLACEMENT PARTS.

\* For Your Own Record, Do Not Cut Out and Return to Factory.

Complete Instructions and Service Parts Manual is available at a cost of \$1.50, from all Wisconsin Distributor's

## Safety Precautions

Never fill fuel tank while engine is running or hot. Avoid the possibility of spilled fuel causing a fire.

Never operate engine in a closed building unless the exhaust is piped outside. This exhaust contains carbon monoxide, a poisonous, odorless and invisible gas, which if breathed causes serious illness and possible death.

Never make adjustments on machinery while it is connected to the engine, without first removing the ignition cables from the spark plug. Turning over the machinery by hand during adjusting or cleaning might start the engine, and machinery with it, causing serious injury to the operator.

Precaution is the best insurance against an accident.

## Winter Storage

To protect the cylinder, piston, rings and valves, and keep them from rusting and sticking, a half and half mixture of kerosene and good gas engine oil, (the same grade as used in the engine crankcase) should be injected into the carburetor air intake while the engine is warm and running at moderate speed. About an eighth of a pint is necessary, or enough so that a heavy bluish smoke will appear at the exhaust. This fogging operation will leave a coating of oil on the above mentioned parts, protecting them from the atmosphere. After the engine has stopped, turn engine over slowly by means of the rope starter sheave, until flywheel key or take-off shaft key-way is up, or in the 12 o'clock position and on compression stroke. Both valves will then be closed and the piston will be on top in the cylinder bore. This will minimize rusting of the cylinder bore and help in retaining the oil fog previously injected into the engine.

Drain crankcase oil while engine is warm.

Drain tank, fuel lines and carburetor of all gasoline, to prevent accumulation of lead and gum deposits in the small passages of the carburetor.

The air cleaner should be thoroughly cleaned (remove oil from oil bath type). Air cleaner and exhaust openings should be taped or otherwise sealed off for the duration of the storage period.

The outside of the engine, including the cooling fins on the cylinder and head, should be thoroughly cleaned of all dirt and other deposits. All exposed unpainted metal parts should be coated with grease or heavy oil.

Before adding new crankcase oil the following season, drain base of condensation which may have accumulated during the storage period.

Use a new spark plug at the beginning of the next season, especially if the engine has given considerable service.

*It is highly recommended that machines be stored inside a building through the winter. If this is not possible, the engine should be protected from snow and ice by a proper covering.*
