

Operation and Maintenance Manual NT/NTA855 Big Cam III

Worldwide Construction/Industrial
and G (Generator) - Drive Engines

Big Cam III

Foreword

This manual contains information for the correct operation and maintenance of your Cummins engine. It also includes important safety information, engine and systems specifications, troubleshooting guidelines, and listings of Cummins Authorized Repair Locations and component manufacturers.

Keep this manual with the equipment. If the equipment is traded or sold, give the manual to the new owner.

The information, specifications, and recommended maintenance guidelines in this manual are based on information in effect at the time of printing. Cummins Engine Company, Inc. reserves the right to make changes at any time without obligation. If you find differences between your engine and the information in this manual, contact your local Cummins Authorized Repair Location.

The latest technology and the highest quality components were used to produce this engine. When replacement parts are needed, we recommend using only genuine Cummins or ReCon® exchange parts. These parts can be identified by the following trademarks:

Note: Warranty information is located in Section W. Make sure you are familiar with the warranty or warranties applicable to your engine.

To the Owner and Operator	i-2

To the Owner and Operator

Preventative maintenance is the easiest and least expensive type of maintenance. Follow the maintenance schedule recommendations outlined in Maintenance Guidelines (Section 2).

Keep records of regularly scheduled maintenance.

Use the correct fuel, oil, and coolant in your engine as specified in Engine Specifications, Section V.

Cummins uses the latest technology and the highest quality components to produce its engines. Cummins recommends using only genuine Cummins parts and ReCon® exchange parts.

Personnel at Cummins Authorized Repair Locations have been trained to provide expert service and parts support. If you have a problem that can **not** be resolved by a Cummins Authorized Repair Location, follow the steps outlined in Service Assistance (Section S).

About the Manual

This manual contains information needed to correctly operate and maintain your engine as recommended by Cummins Engine Company, Inc. Additional service literature can be ordered from your Cummins distributor. For problems with literature orders, contact 1-800-DIESELS (1-800-343-7357) (for U.S.A. and Canada).

This manual does **not** cover vehicle or equipment maintenance procedures. Consult the vehicle or equipment manufacturer for specific maintenance recommendations.

Both metric and U.S. customary values are listed in this manual. The metric value is listed first, followed by the U.S. customary in brackets.

Numerous illustrations and symbols are used to aid in understanding the meaning of the text. Refer to page i-3 for a complete listing of symbols and their definitions.

Each section is preceded by a "Section Contents" to aid in locating information.

How to Use the Manual

This manual is organized according to intervals at which maintenance on your engine is to be performed. A table that states the required intervals and the checks to be made is located in Section 2. Locate the interval at which you are performing maintenance. Then follow the steps given in that section for all the procedures to be performed. In addition, all of the procedures done under previous maintenance intervals **must** be performed.

Keep a record of all the checks and inspections made. A record form for recording date, mileage/kilometer or hours, and what maintenance checks were performed is located in Section 2.

Refer to Section T for a guide to troubleshoot your engine. Follow the directions given on page T-2 to locate and correct engine problems.

Refer to Section V for specifications recommended by Cummins Engine Company, Inc., for your engine. Specifications and torque values for each engine system are given in that section.

Symbols

The following symbols have been used in this manual to help communicate the intent of the instructions. When one of the symbols appears, it conveys the meaning defined below:

WARNING - Serious personal injury or extensive property damage can result if the warning instructions are **not** followed.

CAUTION - Minor personal injury can result or a part, an assembly, or the engine can be damaged if the caution instructions are **not** followed.

Indicates a **REMOVAL** or **DISASSEMBLY** step.

Indicates an **INSTALLATION** or **ASSEMBLY** step.

INSPECTION is required.

CLEAN the part or assembly.

PERFORM a mechanical or time **MEASUREMENT**.

LUBRICATE the part or assembly.

Indicates that a **WRENCH** or **TOOL SIZE** will be given.

TIGHTEN to a specific torque.

PERFORM an electrical **MEASUREMENT**.

Refer to another location in this manual or another publication for additional information.

The component weighs 23 kg [50 lb] or more. To avoid personal injury, use a hoist or get assistance to lift the component.

Simbolos

Los símbolos siguientes son usados en este manual para clarificar el proceso de las instrucciones. Cuando aparece uno de estos símbolos, su significado se especifica en la parte inferior.

ADVERTENCIA - Serios daños personales o daño a la propiedad puede resultar si las instrucciones de Advertencia **no** se consideran.

PRECAUCION - Daños menores pueden resultar, o de piezas del conjunto o el motor puede averiarse si las instrucciones de Precaución **no** se siguen.

Indica un paso de **REMOCION** o **DESMONTAJE**.

Indica un paso de **INSTALACION** o **MONTAJE**.

Se requiere **INSPECCION**.

LIMPIESE la pieza o el montaje.

EJECUTESE una **MEDICION** mecánica o del tiempo.

LUBRIQUESE la pieza o el montaje.

Indica que se dará una **LLAVE DE TUERCAS** o el **TAMAÑO DE HERRAMIENTA**.

APRIETESE hasta un par torsor específico.

EJECUTESE una **MEDICION** eléctrica.

Para información adicional refiérase a otro emplazamiento de este manual o a otra publicación anterior.

El componente pesa 23 kg [50 lb] o mas. Para evitar dano corporal empleen una cabria u obtengan ayuda para elevar el componente.

Symbole

In diesem Handbuch werden die folgenden Symbole verwendet, die wesentliche Funktionen hervorheben. Die Symbole haben folgende Bedeutung:

WARNUNG - Wird die Warnung **nicht** beachtet, dann besteht erhöhte Unfall- und Beschädigungsgefahr.

VORSICHT - Werden die Vorsichtsmassnahmen **nicht** beachtet, dann besteht Unfall- und Beschädigungsgefahr.

AUSBAU bzw. **ZERLEGEN**.

EINBAU bzw. **ZUSAMMENBAU**.

INSPEKTION erforderlich.

Teil oder Baugruppe **REINIGEN**.

DIMENSION - oder **ZEITMESSUNG**.

Teil oder Baugruppe **ÖLEN**.

WERKZEUGGRÖSSE wird angegeben.

ANZUG auf vorgeschriebenes Drehmoment erforderlich.

Elektrische **MESSUNG DURCHFÜHREN**.

Weitere Informationen an anderer Stelle bzw. in anderen Handbüchern.

Das teil wiegt 23 kg [50 lb] oder mehr. Zur vermeidung von koerperverletzung winde benutzen oder hilfe beim heben des teils in anspruch nehmen.

Symboles

Les symboles suivants sont utilisés dans ce manuel pour aider à communiquer le but des instructions. Quand l'un de ces symboles apparaît, il évoque le sens défini ci-dessous:

AVERTISSEMENT - De graves lésions corporelles ou des dommages matériels considérables peuvent survenir si les instructions données sous les rubriques "Avertissement" **ne sont pas** suivies.

ATTENTION - De petites lésions corporelles peuvent survenir, ou bien une pièce, un ensemble ou le moteur peuvent être endommagés si les instructions données sous les rubriques "Attention" **ne sont pas** suivies.

Indique une opération de **DEPOSE**.

Indique une opération de **MONTAGE**.

L'INSPECTION est nécessaire.

NETTOYER la pièce ou l'ensemble.

EFFECTUER une **MESURE** mécanique ou de temps.

GRAISSER la pièce ou l'ensemble.

Indique qu'une **DIMENSION DE CLE** ou **D'OUTIL** sera donnée.

SERRER à un couple spécifique.

EFFECTUER une **MESURE** électrique.

Se reporter à un autre endroit dans ce manuel ou à une autre publication pour obtenir des informations plus complètes.

Le composant pèse 23 kg [50 lb] ou davantage. Pour éviter toute blessure, employer un appareil de levage ou demander de l'aide pour le soulever.

Illustrations

Use the illustrations in this manual as a guide to perform the action or the repair described. Many illustrations are generic and will **not** look exactly like the engine or the parts used in your application. In order to provide clarity to illustrations, some illustrations show parts removed that are **not** related to the specific parts given in the text.

Most of the illustrations contain symbols to indicate an action required or to indicate an **acceptable (OK)** or **unacceptable (not OK)** condition.

The illustrations are intended to show repair or replacement procedures. The illustration can differ from your application, but the procedure given will be the same.

General Safety Instructions

Important Safety Notice

WARNING

Improper practices or carelessness can cause burns, cuts, mutilation, asphyxiation or other bodily injury or death.

Read and understand all of the safety precautions and warnings before performing any repair. This list contains the general safety precautions that **must** be followed to provide personal safety. Special safety precautions are included in the procedures when they apply.

- Make sure the work area surrounding the product is dry, well lit, ventilated; free from clutter, loose tools, parts, ignition sources and hazardous substances. Be aware of hazardous conditions that can exist.
- **Always** wear protective glasses and protective shoes when working.
- Rotating parts can cause cuts, mutilation or strangulation.
- Do **not** wear loose-fitting or torn clothing. Remove all jewelry when working.
- Disconnect the battery (negative [-] cable first) and discharge any capacitors before beginning any repair work. Disconnect the air starting motor if equipped to prevent accidental engine starting. Put a "Do Not Operate" tag in the operator's compartment or on the controls.
- Use **ONLY** the proper engine barring techniques for manually rotating the engine. Do **not** attempt to rotate the crankshaft by pulling or prying on the fan. This practice can cause serious personal injury, property damage, or damage to the fan blade(s) causing premature fan failure.
- If an engine has been operating and the coolant is hot, allow the engine to cool before you slowly loosen the filler cap and relieve the pressure from the cooling system.
- Do **not** work on anything that is supported **ONLY** by lifting jacks or a hoist. **Always** use blocks or proper stands to support the product before performing any service work.
- Relieve all pressure in the air, oil, and the cooling systems before any lines, fittings, or related items are removed or disconnected. Be alert for possible pressure when disconnecting any device from a system that utilizes pressure. Do **not** check for pressure leaks with your hand. High pressure oil or fuel can cause personal injury.
- To prevent suffocation and frostbite, wear protective clothing and **ONLY** disconnect liquid refrigerant (freon) lines in a well ventilated area. To protect the environment, liquid refrigerant systems **must** be properly emptied and filled using equipment that prevents the release of refrigerant gas (fluorocarbons) into the atmosphere. Federal law requires capture and recycling refrigerant.
- To avoid personal injury, use a hoist or get assistance when lifting components that weigh 23 kg [50 lb] or more. Make sure all lifting devices such as chains, hooks, or slings are in good condition and are of the correct capacity. Make sure hooks are positioned correctly. **Always** use a spreader bar when necessary. The lifting hooks **must not** be side-loaded.
- Corrosion inhibitor contains alkali. Do **not** get the substance in your eyes. Avoid prolonged or repeated contact with skin. Do **not** swallow internally. In case of contact, immediately wash skin with soap and water. In case of contact, immediately flood eyes with large amounts of water for a minimum of 15 minutes. **IMMEDIATELY CALL A PHYSICIAN. KEEP OUT OF REACH OF CHILDREN.**
- Naptha and Methyl Ethyl Ketone (MEK) are flammable materials and **must** be used with caution. Follow the manufacturer's instructions to provide complete safety when using these materials. **KEEP OUT OF REACH OF CHILDREN.**
- To avoid burns, be alert for hot parts on products that have just been turned OFF, and hot fluids in lines, tubes, and compartments.
- **Always** use tools that are in good condition. Make sure you understand how to use them before performing any service work. Use **ONLY** genuine Cummins or Cummins Recon® replacement parts.
- **Always** use the same fastener part number (or equivalent) when replacing fasteners. Do **not** use a fastener of lesser quality if replacements are necessary.
- Do **not** perform any repair when fatigued or after consuming alcohol or drugs that can impair your functioning.
- Some state and federal agencies in the United States of America have determined that used engine oil can be carcinogenic and can cause reproductive toxicity. Avoid inhalation of vapors, ingestion, and prolonged contact with used engine oil.

Engine Identification

Cummins Engine Nomenclature

The model name provides the following data:

N T A 855 A

Engine Dataplate

The engine dataplate shows specific information about your engine. The engine serial number (E.S.N.) (1), Control Parts List (CPL) (2), Model (3), and Horsepower and RPM rating provide information for ordering parts and service needs.

NOTE: The engine dataplate **must not** be changed unless approved by Cummins Engine Company, Inc.

Engine No.	S.O. No.	E.C.S.		VEHICLE EMISSION CONTROL INFORMATION: This engine conforms to U.S. EPA and the CARB regulations applicable to Model Year New Heavy Heavy-Duty Engines. This engine has a primary intended service application as a heavy heavy-duty diesel engine.
Model	Ref. No.	Injection timing code		
Advertised HP at RPM	Engine Cert. Ident.	Injector torque Inch-Lbs.		
Conf. No.	C.I.D. Family CPL	Injector travel Inch		
Date of mfg.	Warranty start date	Valve lash cold Int. Exh.		
Manufactured by Cummins Engine Company, Inc. U.S.A. 304550			Fuel rate at advertised HP mm ³ stroke	Idle Speed RPM

General Specifications

	Metric [U.S. Customary]
NOTE: Listed below are general specifications for this engine. Refer to each System Section for additional specifications.	
Engine Speed	Refer to the engine dataplate for optional speed rating.
Displacement	14.0 liters [855 C.I.D.]
Bore and stroke	140 mm [5.5 in] x 152 mm [6.0 in]
Engine Weight	
Dry	1303 kg [2870 lbs] to 1330 kg [2930 lbs]
Wet	1348 kg [2970 lbs] to 1376 kg [3030 lbs]
Firing order	1-5-3-6-2-4
Valve and injector settings:	
Intake valve adjustment	0.28 mm [0.011 in]
Intake valve limits	0.15 to 0.41 mm [0.006 to 0.016 in]
Exhaust valve adjustment	0.58 mm [0.023 in]
Exhaust valve limits	0.46 to 0.76 mm [0.018 to 0.030 in]
Top Stop injector adjustment (in engine)	0.6 to 0.7 N•m [5 to 6 in-lb]
Top Stop injector recheck limits	0.00 to 0.05 mm [0.000 to 0.002 in lash]
STC Top Stop injector adjustment (in engine)	0.6 to 0.7 N•m [5 to 6 in-lb]
STC Top Stop injector recheck limits	0.00 to 0.05 mm [0.000 to 0.002 in lash]

General Engine Data

Cylinder Location and Firing Order:

1-5-3-6-2-4

Intake and **Exhaust** Valve Locations.

Air Induction System

Metric [U.S. Customary]

Maximum Allowable Intake Restriction:

- With Clean Filter Element 380 mm-H₂O
[15 in-H₂O]
- With Dirty Filter Element 635 mm-H₂O
[25 in-H₂O]

Lubricating Oil System

Oil pressure at idle (minimum allowable) 70 kPa [10 psi] minimum

At no load governed speed 240-310 kPa [35-45 psi]

Oil capacity of standard engine:

Bypass filter 2.65 liters [0.7 U.S. gal.]

Full flow filter 2.65 liters [0.7 U.S. gal.]

Combination filter 2.65 liters [0.7 U.S. gal.]

Oil pan capacity (high-low):

G-Drive 28.4 to 36 liters [7.5 to 9.5 U.S. gal.]

Other Applications 26 to 34 liters [7.0 to 9.0 U.S. gal.]

Cooling System

Coolant capacity (engine only) 21 liters [22 U.S. quarts]

Standard modulating thermostat range 79 to 91°C [175 to 195°F]

Minimum recommended operating temperature (top tank) 70°C [158°F]

Maximum recommended operating temperature (top tank) 95°C [203°F]

Minimum recommended pressure cap 48 kPa [7 psi]

Exhaust System

Maximum allowable back pressure imposed by piping and silencer 76 mm H₂O [3 in. Hg]

Maximum bending movement to turbocharger flange 27 N•m [20 ft-lb]

Exhaust pipe size 127 mm [5 in.]

Fuel System

NOTE: For performance and fuel rate values, refer to the engine data sheet or the fuel pump code for the particular model involved.

Maximum Allowable Restriction to Pump (at rated power):

- With Clean Filter 100 mm Hg [4 in Hg]
- With Dirty Filter 200 mm Hg [8 in Hg]

Maximum Allowable Return Line Restriction Without Check Valves 63 mm Hg [2.5 in Hg]

Maximum Allowable Return Line Restriction
with Check Valves and/or Overhead Tanks 165 mm Hg [6.5 in Hg]

Minimum Fuel Vent Capability 0.85 m³/h [30 ft³/hr]

Electrical System

Minimum Recommended Battery Capacity

System Voltage	Ambient Temperatures			
	-18°C [0°F]		0°C [32°F]	
	Cold Cranking Amperes	Reserve Capacity* Amperes	Cold Cranking Amperes	Reserve Capacity* Amperes
12 Volt	1800	640	1280	480
24 Volt**	900	320	640	240

* **Note:** The number of plates within a given battery size determines reserve capacity. Reserve capacity determines the length of time sustained cranking can occur.

** **Note:** CCA ratings are based on two, 12 volt batteries in series.

Batteries (State of Charge)

Battery State of Charge	Specific Gravity @ 27°C [80°F]
100%	1.260-1.280
75%	1.230-1.250
50%	1.200-1.190
25%	1.170-1.190
Discharged	1.110-1.130

External Engine Components

The illustrations which follow show the locations of the major external engine components, the filters, and other service and maintenance points. Some external components will be at different locations for different engine models. NT855 engines will **not** include an aftercooler, item No. 2 below.

1. Fan Hub
2. Aftercooler
3. Air Compressor
4. Fuel Pump
5. Starting Motor
6. Vibration Damper

Fuel Pump Side

1. Turbocharger
2. Oil Cooler
3. Coolant Outlet
4. Thermostat Housing
5. Coolant Inlet
6. Full Flow Oil Filter
7. Bypass Oil Filter
8. Dipstick
9. Flywheel Housing

Starting Procedure - After Extended Shutdown or Engine Oil Change	1-5
Step Timing Control	1-7

General Information

Correct care of your engine will result in longer life, better performance, and more economical operation.

- Follow the daily maintenance checks listed in Maintenance Guidelines, Section 2.
- Check the oil pressure indicators, temperature indicators, warning lights, and other gauges daily to make sure they are operational.

Warning: DO NOT OPERATE A DIESEL ENGINE WHERE THERE ARE OR CAN BE COMBUSTIBLE VAPORS. These vapors can be sucked through the air intake system and cause engine acceleration and overspeeding which in turn can destroy the engine and result in a fire, personal injury and extensive property damage. Numerous safety devices are available, such as air intake shutoff devices, to minimize the risk of overspeeding where an engine, due to its application, can operate in a combustible environment, such as due to a fuel spill or gas leak. Remember, Cummins has no way of knowing the use you have for your engine. **THE EQUIPMENT OWNER AND OPERATOR ARE RESPONSIBLE FOR SAFE OPERATION IN A HOSTILE ENVIRONMENT. CONSULT YOUR CUMMINS AUTHORIZED REPAIR LOCATION FOR FURTHER INFORMATION CONCERNING PROTECTIVE DEVICES SUITABLE FOR YOUR APPLICATION.**

Normal Starting Procedures (Above 0°C [32°F])

- Disengage the driven unit or, if equipped, put the transmission in neutral.
- Start the engine with the throttle in the idle position.

Caution: To prevent damage to the starting motor, do not engage the starting motor more than 30 seconds. Wait 2 minutes between each attempt to start (electrical starting motors only).

NOTE: Air type starting motors require a minimum of 480 kPa [70 psi] air pressure to function correctly.

- Engine oil pressure **must** be indicated on the gauge within 15 seconds after starting.
- When starting a cold engine, increase the engine speed (RPM) slowly to provide adequate lubrication to the bearings and to allow the oil pressure to stabilize.

NOTE: Do **not** idle the engine for excessively long periods. Long periods of idling (more than 10 minutes) can damage an engine because combustion chamber temperatures drop so low the fuel will **not** burn completely. This will cause carbon to clog the injector spray holes and piston rings, and can cause the valves to stick. If the engine coolant temperature becomes too low (60°C [140°F]), raw fuel will wash the lubricating oil off the cylinder walls and dilute the crankcase oil; therefore, all moving parts of the engine will **not** receive the correct amount of lubrication which can reduce engine life.

- Idle the engine 3 to 5 minutes at approximately 1,000 RPM before operating with a load.

Caution: When using jumper cables to start the engine, make sure to connect the cables in parallel: positive (+) to positive (+) and negative (-) to negative (-). When using an external electrical source to start the engine, turn the disconnect switch to the "OFF" position. Remove the key before attaching the jumper cables.

Cold Weather Engine Operation

Satisfactory performance of a diesel engine operating in low ambient temperature conditions requires modification of the engine, surrounding equipment, operating practices and maintenance procedures. The colder the temperatures encountered, the greater the amount of modification required and yet with the modifications applied, the engines **must** still be capable of operation in warmer climates without extensive changes. The following information is provided to engine owners, operators and maintenance personnel on how the modifications can be applied to get satisfactory performance from their diesel engines.

There are three basic objectives to be accomplished:

1. Reasonable starting characteristics followed by practical and dependable warm-up of the engine and equipment.
2. A unit or installation which is as independent as possible from external influences.
3. Modifications which maintain satisfactory operating temperatures with a minimum increase in maintenance of the equipment and accessories.

If satisfactory engine temperature is **not** maintained, higher maintenance cost will result due to the increased engine wear, poor performance and formation of excessive carbon, varnish and other deposits. Special provisions to overcome low temperatures are definitely necessary, whereas a change to warmer climate normally requires only a minimum of revision. Most of the accessories will be designed in such a way that they can be disconnected so there is little effect on the engine when they are **not** in use.

The two most commonly used terms associated with preparation of equipment for low temperature operation are **Winterization** and **Arctic Specifications**.

Winterization of the engine and/or components so starting and operation are possible in the lowest temperature to be encountered requires:

1. Use of correct materials.
2. Proper lubrication, low temperature lubricating oils.
3. Protection from the low temperature air. The metal temperature does **not** change, but the rate of heat dissipation is affected.
4. Fuel of the proper grade for the lowest temperature.
5. Heating to be provided to increase the engine block and component temperature to a minimum of -32°C [-25°F] for starting in lower temperatures.
6. Proper external heating source available.
7. Electrical equipment capable of operating in the lowest expected temperature.

Arctic specifications refer to the design material and specifications of the components necessary for satisfactory engine operation in extreme low temperatures -54°C [-65°F]. Contact Cummins Engine Company, Inc. or the equipment manufacturer to obtain the special items required.

For additional information on cold weather operation, obtain Service Bulletin No. 3379009, Engine Operation in Cold Weather, from the nearest Cummins Distributor or dealer.

Cold Weather Starting Aids

Ether Starting Aid

Warning: Starting fluid contains ether and is extremely flammable. Misuse or mishandling can cause an explosion. NEVER handle starting fluid near an open flame. NEVER use starting fluid with a preheater, glow plug, flame thrower or other type of electrical starting equipment. Do NOT breathe the fumes as serious injury to the human respiratory system will result. Fuel oil or volatile fuel cold starting aids are not to be used in underground mine or tunnel operations.

Caution: Using too much starting fluid will cause extremely high pressures and detonation in the engine cylinders, resulting in damage to the cylinder parts and bearings. Too much starting fluid can also cause damage from engine overspeed.

Manually Operated Ether Valve

The manually operated ether valve includes the valve body assembly (5), clamp (2), and nylon tube (3). The fuel cylinder (1), atomizer fitting (4) and pull control (6) **must** be ordered separately.

Standard pull or throttle control cables can be used to actuate the manual valve, if desired.

Electrically Operated Ether Valve

The electrically operated ether valve includes the valve body (7), 90 degree elbow (5), clamp (2), push button switch (6), and nylon tube (3). A thermostat is mounted on the engine exhaust manifold and cuts out the valve by sensing manifold heat when the engine is running. See the Parts Catalog for fuel cylinder (1) and fuel atomizer fittings (4). These fittings **must** be ordered separately, as required.

Installation Recommendations

The atomizer fittings **must** be mounted in the engine air intake manifold or inlet connection to provide an equal distribution of starting fuel to each cylinder. The atomizer holes are 180 degrees apart and **must** be mounted so the spray is injected the long way of the manifold. If incorrectly installed, the spray goes crosswise of the manifold.

Cold Weather Starting Procedures

Without Metering Equipment

-  **Warning:** Cummins Engine Company, Inc. does not recommend the use of unmetered starting fluid. Uncontrolled use of starting fluid will cause engine damage.
-  **Warning:** Do not use starting fluid near an open flame or with a preheater or flame thrower equipment. This combination can cause an explosion.
-  **Warning:** Do not breathe starting fluid fumes. Starting fluid fumes can be harmful to your health.
-  **Caution:** Do not use excessive amounts of starting fluid when starting an engine. The use of too much starting fluid will cause engine damage.
-  **Warning:** Do not use volatile cold starting aids in underground mine or tunnel operations due to the potential of an explosion. Check with the local U.S. Bureau of Mines Inspector for instructions.

Use of starting fluid without metering equipment is **not** a recommended policy of Cummins Engine Company, Inc. If it is necessary to use this method:

- Set the throttle at idle.
- Disengage the driven unit or make sure the gears are in neutral.
- Open the manual fuel shut-down valve, or electric shut-down valve, whichever is used.
- Engage the starter and while cranking the engine, spray starting fluid into the intake of the air cleaner for 2 seconds. The starting fluid vapors will be drawn into the air intake manifold and the engine can start.
- If the engine begins to stop, spray the fluid into the intake of the air cleaner for 1 second. **Never** apply a continuous spray to keep the engine running or engine damage will result. Wait at least 10 seconds between one spray sequence and the next.

With Mechanical or Electrical Metering Equipment

- Set the throttle at idle.
- Disengage the driven unit or, if equipped, put the transmission in neutral.
- Activate the switch to open the fuel pump shutoff valve.
- While cranking the engine, push the electric button or pull the cable to inject measured amounts of fluid into the engine.

If the engine begins to stop, activate the push button or cable again.

Cold Weather Protection

NOTE: Anti-leak antifreezes are **not** recommended for use in Cummins engines. Although these antifreezes are chemically compatible with DCA water treatment, the anti-leak agents can clog the coolant filters and render them ineffective.

For cold weather operation, use of permanent type antifreeze with rust inhibitor additives is recommended.

If antifreeze is **not** used and the ambient temperature is at or below the freezing point 0°C [32°F], the entire cooling system **must be drained when the engine is not** to be operated. Drain the cylinder block and heads on all engines by opening the petcocks and removing the drain plugs. If an air compressor, heat exchange or other water cooled accessory is used, open the petcock and drain. Failure to properly drain the engine and accessories can cause serious damage during freezing weather.

Immersion type water and oil heaters are available for engines used in cold weather operations and to maintain temperatures to permit the engine to operate at full load at start-up.

Starting Procedure - After Extended Shutdown or Engine Oil Change

Complete the following steps after each oil change or after the engine has been shut off for more than 3 days to make sure the engine receives the correct oil flow through the lubricating system:

- Disconnect the electrical wire from the fuel pump solenoid valve.
- Rotate the crankshaft by the starting motor until oil pressure appears on the gauge or the warning light goes out.
- Connect the electrical wire to the fuel pump solenoid valve.
- Start the engine. (Refer to Normal Starting Procedures).

Operating the Engine

- Do **not** operate the engine at full throttle below peak torque engine speed (RPM) for extended periods (more than 30 seconds) of time.
- Allow the engine to idle 3 to 5 minutes before shutting it off after a full load operation. This allows adequate cool down of pistons, cylinder liners, bearings, and turbocharger components.
- Monitor the oil pressure and coolant temperature gauges frequently. Refer to Lubricating Oil System or Cooling System, Section V, for recommended operating pressures and temperatures. Shut off the engine if any pressure or temperature does **not** meet the specifications.

Caution: Continuous operation with low coolant temperature (below 60°C [140°F]) or high coolant temperature (above 100°C [212°F]) can damage the engine.

- If an overheating condition starts to occur, reduce the power output of the engine by releasing the throttle pressure or shifting the transmission to a lower gear, or both, until the temperature returns to normal operating range. If the engine temperature does **not** return to normal, shut off the engine and refer to Troubleshooting, Section T, or contact a Cummins Authorized Repair Location.
- Most failures give an early warning. Look and listen for changes in performances, sound, or engine appearance that can indicate service or engine repair is needed. Some changes to look for are as follows:
 - Engine misfires
 - Excessive vibration
 - Unusual engine noises
 - Fuel, oil, or coolant leaks
 - Sudden changes in engine operating temperature or pressure
 - Excessive smoke
 - Loss of power
 - An increase in oil consumption
 - An increase in fuel consumption

Engine Operating Range

Caution: Operating the engine beyond high idle speed can cause severe engine damage. The engine speed must not exceed 2450 RPM under any circumstances. When descending a steep grade, use a combination of transmission gears and engine or service brakes to control the vehicle and engine speed.

Cummins heavy-duty engines are designed to operate successfully at full throttle under transient conditions down to peak torque engine speed (RPM). This is consistent with recommended operating practices for good fuel economy.

Excessive full throttle operation below peak torque RPM will shorten engine life to overhaul, can cause serious engine damage, and is considered engine abuse. Peak torque RPM varies from 1,100 RPM to 1,500 RPM, depending upon rated engine speed.

Operation of the engine below peak torque RPM can occur during gear shifting due to the difference of ratios between transmission gears, but engine operation **must not** be sustained (more than 30 seconds) at full throttle below peak torque RPM.

Engine Shut-Down

Engine Operation Before Shutdown

It is important to idle the engine 3 to 5 minutes before shutting it down to allow the lubricating oil and water to carry heat away from the combustion chamber, bearings, shafts, etc. This is especially important with turbocharged engines.

The turbocharger contains bearings and seals that are subject to the high heat of combustion exhaust gases. While the engine is running, this heat is carried away by oil circulation; but if the engine is stopped suddenly, the turbocharger temperature can rise as much as 38°C [100°F]. The results of the extreme heat can be seized bearings or loose oil seals.

NOTE: Do **not** idle for excessively long periods.

Long periods of idling are **not** good for an engine because the combustion chamber temperatures drop so low the fuel can **not** burn completely. This will cause carbon to clog the injector spray holes and piston rings and can result in stuck valves.

If the engine coolant temperature becomes too low, raw fuel will wash the lubricating oil off the cylinder walls and dilute the crankcase oil so all moving parts of the engine will suffer from poor lubrication.

If the engine is **not** being used, shut it down.

The engine can be shut down completely by turning off the switch on installations equipped with an electric shut-down valve, or by turning the manual shut-down valve knob. Turning off the switch which controls the electric shut-down valve stops the engine unless the override button on the shut-down valve has been locked in the open position. If the manual override on the electric shut-down valve is being used, turn the button fully **counterclockwise** to stop the engine. Refer to Normal Starting Procedure. The valve can **not** be reopened by the switch until after the engine comes to a complete stop, unless a rapid restart valve is installed.

Caution: Do not leave the switch key or the override button in the valve open or in the run position when the engine is not running. With overhead tanks this can allow fuel to drain into the cylinders, causing a hydraulic lock. Therefore, stop the engine immediately in the event of any malfunction or part failure.

Practically all failures give some warning to the operator before the parts fail and ruin the engine. Many engines are saved because alert operators heed warning signs (sudden drop in oil pressure, unusual noises, etc.) and immediately shut down the engine.

Power Takeoff With Variable Speed Control

The variable speed governor on power takeoff applications is used to control engine speed at the desired RPM.

To engage the variable speed governor with the engine idling on standard throttle:

- Put the variable speed control lever in the low idle position.
- Lock the standard throttle lever in the full open position.
- Put the variable speed control lever in the operating position desired.

To return to standard throttle operation:

- Return the standard throttle lever to the idle position.
- Lock the variable speed control lever in the maximum speed position.

Step Timing Control

Some engine models are equipped with step timing control (STC). STC allows the engine to operate in advanced injection timing during start-up and light duty engine load conditions and to return to normal timing during medium and high engine load conditions.

Caution: Do not attempt to bypass or otherwise tamper with the STC oil control valve or plumbing. This will result in the loss of both fuel economy and engine durability. Correct valve operation is necessary to maintain acceptable cylinder pressures and temperatures and to yield optimal fuel economy during high-load operation and to control white smoke at idle.

Benefits include:

- Improved cold weather idling characteristics
- Reduced cold weather white smoke.
- Improved light load fuel economy.
- Reduced injector carboning.

When operating in the advanced mode, a light ticking noise can be noted at the top of the engine. This sound is normal and is caused by the actuation of the STC hydraulic tappets during each injection cycle.

For optimal white smoke control on STC equipped engines, do **not** increase engine speed above idle during engine start-up until sufficient oil pressure reaches the STC tappets to shift all injectors into the advanced timing mode.

This image shows a single sheet of white paper with horizontal ruling lines. The lines are evenly spaced and run across the width of the page. There are no margins, text, or other markings on the paper.

Section 2 - Maintenance Guidelines
Section Contents

	Page
Engine Maintenance Schedule	2-3
Page References for Maintenance Instructions	2-4
General Information	2-2
Tool Requirements	2-2

General Information

Cummins Engine Company, Inc. recommends that the engine be maintained according to the Maintenance Schedule on page 2-3.

If the engine is operating in ambient temperatures consistently below -18°C [0°F] or above 38°C [100°F], perform maintenance at shorter intervals. Shorter maintenance intervals are also required if the engine is operated in a dusty environment or if frequent stops are made. See your Cummins Authorized Repair Location for recommended intervals.

NOTE: Some of these maintenance procedures require special tools or **must** be done by qualified personnel. These procedures are outlined in the specific manuals as follows:

Procedure	Bulletin No.	Description
• Adjust the Valves and Injectors	3379076-05 3810298	NTA855 Shop Manual NT855 Troubleshooting & Repair Manual
• Clean and Calibrate the Injectors	3379071	Injector PT Rebuild Manual
• Clean and Calibrate the Injectors	3810313	PT (Type D) STC Injector Shop Manual
• Clean and Calibrate the Fuel Pump	3379084	Fuel Pump (PT Type G) Rebuild and Calibrate
• Repair and Rebuild Components*	3379076-05	NTA855 Shop Manual

*If your engine is equipped with a component or an accessory **not** manufactured by Cummins Engine Company, Inc., refer to the component manufacturer's maintenance recommendations. A listing of suppliers' addresses and telephone numbers is provided in Component Manufacturers, Section C.

Use the chart provided on page 2-6 as a convenient way to keep a record of maintenance performed.

Tool Requirements

Most of the maintenance operations described in this manual can be performed with common hand tools (S.A.E. wrenches, sockets, and screwdrivers).

The following is a list of special service tools required for some maintenance operations:

Tool Part No.	Description
3375049	Oil Filter Wrench
3376592	5 to 6 Inch Pound Torque Wrench
3376807	Water/Fuel Filter Wrench
3822524	Belt Tension Gauge (Click-Type)
3822525	Belt Tension Gauge (Click-Type)
3823348	Top Stop Tappet Setting Tool (STC equipped engines only)
ST-1293	Belt Tension Gauge (v-belts)

Refer to the appropriate sections for a description of the tools and how to use them.

Contact your nearest Cummins Authorized Repair Location for the required service tools.

Engine Maintenance Schedule

Drain	3-3
General Information	3-2
Oil Level	3-3
Checking	3-3
Unusual Engine Noise	3-2
Checking	3-2

General Information

Preventative maintenance begins with day-to-day awareness of the condition of the engine and its systems.

Before starting the engine, check the oil and coolant levels. Look for:

- Leaks
- Loose or damaged parts
- Worn or damaged belts
- Any change in engine appearance

Engine Operation Report

The engine **must** be maintained in top mechanical condition if the operator is to get optimum satisfaction from its use. The maintenance department needs daily running reports from the operator to make necessary adjustments in the time allotted and to make provisions for more extensive maintenance work as the reports indicate the necessity.

Comparison and intelligent interpretation of the daily report along with a practical follow-up action will eliminate most failures and emergency repairs.

Report to the maintenance department any of the following conditions:

- Low lubricating oil pressure
- Low power
- Abnormal water or oil temperature
- Unusual engine noise
- Excessive smoke
- Excessive use of coolant, fuel or lubricating oil
- Any fuel, coolant or lubricating oil leaks.

Unusual Engine Noise

Checking

During the daily maintenance check, listen for any unusual engine noise which can indicate that service is required.

Fuel-Water Separator

Drain

NOTE: The water and sediment may contain petroleum products. Please consult the local environmental agency for recommended disposal guidelines.

Cummins requires that a fuel-water separator or fuel filter and water separator be installed in the fuel supply system. Drain the water and sediment from the separator daily.

Shut off the engine. Use your hand to open the drain valve. Turn the valve **counterclockwise** until draining occurs and the valve drops at least one inch out of the filter. Drain the filter sump of water until clear fuel is visible.

Caution: Do not overtighten the valve. Overtightening can damage the threads.

Turn the valve **clockwise** to close the drain valve.

Oil Level

Checking

Check the oil level daily.

Never operate the engine with the oil level below the "L" (Low) mark or above the "H" (High) mark. Wait at least 5 minutes after shutting off the engine to check the oil. This allows time for the oil to drain to the oil pan.

NOTE: The vehicle **must** be level when checking the oil level to make sure the measurement is correct.

Coolant Level

Checking

Warning: Do not remove the radiator cap from a hot engine. Wait until the temperature is below 50°C [120°F] before removing the pressure cap. Failure to do so can result in personal injury from heated coolant spray or steam. Remove the filler cap slowly to relieve coolant system pressure.

Never use a sealing additive to stop leaks in the coolant system. This can result in coolant system plugging and inadequate coolant flow causing the engine to overheat.

The coolant level **must** be checked daily.

Caution: Do not add cold coolant to a hot engine. Engine castings can be damaged. Allow the engine to cool to below 50°C [120°F] before adding coolant.

Makeup coolant added to the engine **must** be mixed with the correct proportions of antifreeze, DCA, and water to avoid engine damage.

Refer to Coolant Recommendations/Specifications in Section V for details on proper mixing of coolant.

Fill the cooling system with coolant to the bottom of the fill neck in the radiator fill or expansion tank.

NOTE: Some radiators have two fill necks, both of which **must** be filled when the cooling system is drained.

Cooling Fan

Inspection

Warning: Personal injury can result from a fan blade failure. Never pull or pry on the fan. This can damage the fan blade(s) and cause fan failure.

NOTE: Manually rotate the crankshaft by using a wrench on the accessory drive pulley nut.

A visual inspection of the cooling fan is required daily. Check for cracks, loose rivets, bent or loose blades, and for contact between the fan blade tips and the fan shroud. Check the fan to make sure it is securely mounted. Tighten the capscrews if necessary. Replace any fan that is damaged.

Belts

Inspection

Visually inspect the belts daily. Replace the belts that are cracked or frayed. Adjust belts that have a glazed or shiny surface which indicates belt slippage. Correctly installed and tensioned belts will show even pulley and belt wear.

Belt damage can be caused by:

- Incorrect tension
- Incorrect size or length
- Pulley misalignment
- Incorrect installation
- Severe operating environment
- Oil or grease on the belts

Belt Tension

Checking

Measure the belt tension in the center span of the pulleys.

Refer to the Drive Belt Tension Chart, Section V, for the correct gauge and tension value for the belt width used.

An alternate method (deflection method) can be used to check belt tension by applying 110 N [25 lbf] force between the pulleys on v-belts. If the deflection is more than one (1) belt thickness per foot of pulley center distance, the belt tension **must** be adjusted.

Refer to Section A for adjustment procedures.

For cogged belts, make sure the belt tension gauge is positioned so that the center tensioning leg is placed directly over the high point (hump) of a cog. Other positioning will result in incorrect measurement.

Air Cleaner Pre-Cleaner and Dust Pan

Checking/Cleaning

Under extremely dirty conditions an air pre-cleaner can be used. Clean the pre-cleaner jar and dry-type air cleaner dust pans daily or more often, as necessary, depending on operating conditions.

This image shows a single sheet of white paper with horizontal ruling lines. The lines are evenly spaced and run across the width of the page. There are no margins, text, or other markings on the paper.

Vacuum Indicator	4-2
Raw Water Inlet Screens (Marine Only)	4-6
Checking.....	4-6

General Information

All checks or inspections listed under the daily maintenance interval **must** also be performed at this time in addition to those listed under this maintenance interval.

Inlet Air Restriction Indicators

Mechanical Indicator

A mechanical restriction indicator is available to indicate excessive air restriction through a dry-type air cleaner. This instrument can be mounted in the air cleaner outlet or on the vehicle instrument panel. The red flag (1) in the window gradually rises as the cartridge loads with dirt. After changing or replacing the cartridge, reset the indicator by pushing the reset button (2).

NOTE: Never remove the felt washer from the indicator. The felt washer absorbs moisture.

Vacuum Indicator

Vacuum switches actuate a warning light on the instrument panel when the air restriction becomes excessive.

Air restriction on turbocharged engines **must not** exceed 635 mm [25 inches H₂O] or 46 mm [1.8 inches] of mercury under full power conditions.

Air Cleaner Element

NOTE: The illustrations in this section show typical parts. The particular engine parts can vary.

Cleaning

The paper element (6) in a dry-type air cleaner can be cleaned several times by using compressed air to remove the dirt, approximately 207 kPa [30 psi]. Do **not** hold the air jet too close to the paper element when cleaning.

Elements that have been cleaned several times will finally clog and air flow to the engine will be restricted. After cleaning, check the restriction as previously described. Replace the element if necessary.

Caution: Holes, loose end seals, dented sealing surfaces and other forms of damage render the cleaner inoperative and require immediate element replacement.

Replacement

Remove the wing nut (1) that secures the bottom cover (2) to the cleaner housing (3). Remove the cover.

Pull the element (6) down from the center bolt (4).

Caution: Pull the cover and the element straight out when removing them from the housing to avoid damage to the element.

Remove the gasket (5) from the outlet end (7) of the housing.

Single - Heavy Duty Dry-Type Element

Heavy duty air cleaners (single and dual types) combine centrifugal cleaning with element filtering before air enters the engines.

Before disassembly, wipe dirt from the cover and the upper portion of the air cleaner.

Loosen the wing bolt, and remove the band securing the dust pan (1).

Loosen the wing nut (2). Remove the dust shield (3) from the dust pan (1). Clean the dust pan and shield.

Remove the wing nut (5) and secure the air cleaner primary element in the air cleaner housing. Inspect the rubber sealing washer on the wing nut (4).

Clean the element from the clean air side with compressed air **not** exceeding 207 kPa [30 psi]. Inspect the element after cleaning. Install the cleaned primary element or a new element.

Make sure the gasket washer is in place under the wing nut before tightening.

Assemble the dust shield and dust pan again. Position them to the air cleaner housing and secure with the band.

Dual - Heavy Duty Dry-Type Element - Replacement

Heavy duty air cleaners (single and dual types) combine centrifugal cleaning with element filtering before air enters the engines.

Before disassembly, wipe dirt from the cover and the upper portion of the air cleaner. To clean the dual types:

Loosen the wing bolt (1), and remove the band securing the dust pan (2).

Loosen the wing nut (3). Remove the dust shield (4) from the dust pan (2). Clean the dust pan and shield.

Remove the wing nut (5) and secure the air cleaner primary element (6) in the air cleaner housing. Inspect the rubber sealing washer on the wing nut (9).

Clean the element from the clean air side with compressed air **not** exceeding 207 kPa [30 psi]. Inspect the element after cleaning. Install the cleaned primary element or a new element.

Make sure the gasket washer is in place under the wing nut before tightening.

Assemble the dust shield and dust pan again. Position them to the air cleaner housing and secure with the band.

On the dual element type Cyclopac cleaner:

Check the air restriction indicator. If the air restriction is excessive, disassemble the air cleaner, remove the wing nut (7) and replace the safety element (8).

Assemble the air cleaner as described above.

Cartridge Type Element - Cleaning

Loosen the wing nuts (4) on the air cleaner housing (5) to remove the pre-cleaner panel with the dust bin (6). To remove the pre-cleaner panel (2) equipped with an exhaust aspirator, loosen the U bolt clamp securing the pre-cleaner to the aspirator tubing.

Remove the dirty Pamic cartridge (3), by inserting your fingers in the cartridge opening (loosen all four corners of the cartridge, one at a time) and pulling it straight out.

With the larger cartridge, it can be necessary to break the seal along the edges of the cartridge. After the seal has been broken, pull the cartridge straight out and slightly up so the cartridge will clear the sealing frame and edges of the air cleaner housing.

Cleaning and Inspection

Clean the pre-cleaner openings (2) of all soot, oil film and any other objects that can become lodged in the openings. Remove any dust or dirt in the lower portion of the pre-cleaner and aspirator tubing. Inspect the inside of the air cleaner housing for foreign material.

Inspect the dirty cartridge for soot or oil. If there is soot inside the Pamic tubes, check for leaks in the engine exhaust system, exhaust blow-back into the air intake and exhaust from other equipment. If the cartridge appears oily, check for fumes escaping from the crankcase breather. Excessive oil mist shortens the life of any dry-type cartridge. Troubleshooting at this point can appreciably lengthen new cartridge life.

It is **not** recommended to clean and reuse the cartridge. When returned to service, life expectancy of a cleaned cartridge will be only a fraction of the original service life.

Inspect clamps and flexible hose or tubing to make sure all fittings are air tight on cleaners with exhaust aspirators.

The pre-cleaner dust (6) bin is self-cleaning.

Assembly

Inspect the new filter cartridge for shipping damage before installing.

To install a new cartridge, hold the cartridge (3) in the same manner as when removing it from the housing. Insert the clean cartridge into the housing, avoiding hitting the cartridge tubes against the sealing flange on the edges of the air cleaner housing.

As the cleaner requires no separate gaskets for seals, care **must** be taken when inserting the cartridge to insure a proper seat within the cleaner housing. Firmly press all edges and corners of the cartridge with your fingers to effect a positive air seal against the sealing flange of the housing. The cartridge **must not** be pounded or pressed in the center to seal.

Replace the pre-cleaner panel (2) and tighten the wing nuts (4) by hand. For final tightness turn the wing nuts 1 to 1 1/2 turns with a small adjustable wrench. Do **not** tighten too much. On a pre-cleaner with an exhaust aspirator, assemble the aspirator tube to the pre-cleaner panel and tighten the U bolt.

Care **must** be taken to keep the cleaner face unobstructed.

Reset the mechanical inlet air restriction indicator.

Air Intake Hoses, Pipes, and Clamps

Inspection

Inspect the intake piping for cracked hoses, loose clamps, or punctures which can damage the engine.

Tighten or replace parts as necessary to make sure the air intake system does **not** leak.

Torque Value: 8 N•m [72 in-lb]

Check for corrosion of the intake system piping under the clamps and hoses. Corrosion can allow corrosive products and dirt to enter the intake system. Disassemble and clean as required.

Air Tanks

Draining

Drain the moisture from the air system wet tank weekly.

Raw Water Inlet Screens (Marine Only)

Checking

Weekly check and clean the marine raw water inlet screens.

Replace as required.

Fuel Filter(s)

Replacement

Every 250 hours or 6 months (whichever occurs first), replace the fuel filter(s). Clean the area around the fuel filter head. Remove the fuel filter. Clean the gasket surface of the filter head.

Use the correct filter(s) for your engine. Cummins requires that a fuel-water separator or a fuel filter and water separator be installed in the fuel supply system.

Standard Filter(s)

Cummins Part No. 3315844
Fleetguard® Part No. FF-105

Superfilter (Fuel-Water Separator)

Cummins Part No. 3315843
Fleetguard® Part No. FS-1212

Use clean oil to lubricate the filter seal. **Fill the new filter(s) with clean fuel.**

Caution: Mechanical overtightening can distort the threads or damage the filter element seal.

Install the filter as specified by the filter manufacturer.

Lubricating Oil and Oil Filter

Changing

Warning: Some state and federal agencies in the United States of America have determined that used engine oil can be carcinogenic and can cause reproductive toxicity. Avoid inhalation of vapors, ingestion, and prolonged contact with used engine oil.

Caution: Avoid direct contact of hot oil with your skin. Hot oil can cause personal injury.

Change the lubricating oil and oil filters at every oil change interval.

Operate the engine until the water temperature reaches 60°C [140°F]. Shut off the engine. Remove the oil drain plug. Drain the oil immediately to make sure all the oil and suspended contaminants are removed from the engine.

Lubricating Oil Filter Specifications

Cummins Engine Company, Inc. requires a lubricating oil filter(s) be used that meets the specifications given in the table below.

Lubricating Oil Filter Specifications			
Per Cummins Source Approval Method (SAM)	Combo (LF3000) 10,634	Full Flow (LF670) 10,509	Bypass (LF777) 10,547
Flow vs. Restriction			
• Pressure differential at 40 GPM maximum	21 kPa [3 psi]	21 kPa [3 psi]	N/A
Element Collapse			
• Pressure differential	1034 kPa [150 psi]	1034 kPa [150 psi]	1034 kPa [150 psi]
Partical Retention			
• Absolute retention, percent of 40 micrometre and above, minimum	N/A	100%	N/A
• Percent retention of 20 to 30 micrometre	N/A	95%	N/A
Hydrostatic Pressure			
• Pressure, minimum	1724 kPa [250 psi]	1724 kPa [250 psi]	1724 kPa [250 psi]

Clean the area around the lubricating oil filter head. Remove the filter. Clean the gasket surface of the filter head.

NOTE: The o-ring can stick on the filter head. Make sure the o-ring is removed.

NOTE: Refer to the Lubricating Oil Filter Specifications Chart on page 5-3.

Caution: Fill the oil filter with clean lubricating oil before installing it on the engine. The lack of engine lubrication while the filter is being pumped full of oil is harmful to the engine.

Use the correct oil filter for your engine.

Combination Full Flow/Bypass Lube Filter

Cummins Part No. 3318853

Fleetguard® Part No. LF-3000

Apply a light film of lubricating oil to the gasket sealing surface **before** installing the new filter.

Caution: Mechanical overtightening can distort the threads or damage the filter element seal.

Install the filter as specified by the filter manufacturer.

Clean and check the oil drain plug threads and the seal surface.

Install and tighten the oil drain plug.

Torque Value: 88 N•m [65 ft-lb]

Use a high quality CE or CF-4 15W-40 multi-viscosity oil such as Cummins Premium Blue or its equivalent in Cummins engines. Choose the correct oil for your operating climate as outlined in Section V.

Fill the engine with clean oil to the correct level. Total system capacity including filter is listed in Section V.

Operate the engine at idle speed to inspect for leaks at the oil filter and the drain plug.

Shut off the engine. Wait approximately 5 minutes to let the oil drain from the upper parts of the engine. Check the oil level again.

Add oil as necessary to bring the oil level to the "H" (high) mark on the dipstick.

Crankcase Breather

Every 250 hours or 6 months, clean and check the crankcase breathers and breather tube.

The tube is to be removed and checked internally for obstructions or sludge buildup.

If the tube is blocked, it is to be cleaned to prevent excess crankcase pressure buildup.

Cleaning and Checking

Loosen the hose clamp at the breather vent tube.

Remove the tube support bracket and capscrew.

Disassemble the breather as shown.

Use solvent to clean the breather. Dry it with compressed air.

Inspect the breather tube, connector hose, and the rubber gasket for cracks or other damage. Replace if necessary.

Use solvent to clean the inside of the crankcase breather tube and dry with compressed air.

Use air pressure to blow through the vent tube.

Replace the vent tube if it is clogged.

Assemble the breather as shown.

Install the vent tube, the hose, the hose clamps, the brackets, and the capscrews on the engine.

Tighten the bracket capscrew (not shown).

Torque Value: 45 N•m [35 ft-lb]

Coolant Filter

Replacement

Change the coolant filter at every oil and filter change interval.

The correct coolant filter to be used is determined by the total cooling system capacity and the oil drain interval.

Refer to the Coolant Recommendations/Specifications in Section V for the correct filter selection and test procedures.

A manual shutoff valve is provided to prevent coolant leakage while changing the coolant filter.

With the valve in the vertical position, the coolant flows to and from the coolant filter. In the horizontal position, the coolant flow is cut off to and from the coolant filter.

Warning: Do not remove the radiator cap from a hot engine. Hot steam will cause serious personal injury. Remove the coolant system pressure cap and close the coolant filter head shutoff valve before removing the coolant filter. Failure to do so can result in personal injury from heated coolant spray.

Turn the coolant shutoff valve to the "OFF" position.

Remove and discard the coolant filter. Clean the gasket surface.

Apply a light film of lubricating oil to the gasket sealing surface before installing the new coolant filter.

Caution: Mechanical overtightening can distort the threads or damage the filter head.

Install the filter as specified by the filter manufacturer.

Open the shut-off valve and install the coolant system pressure cap.

Caution: Engine damage will result if the valve is left closed.

Operate the engine, and check for coolant leaks.

After the air has been purged from the system, check the coolant level again.

Coolant Additive Concentration

Checking

Warning: Check the coolant level only when the engine is stopped. Wait until the coolant temperature is below 50°C [120°F] before removing the pressure cap. Failure to do so can cause personal injury from heated coolant spray.

Operate the engine, and check for coolant leaks.

After the air has been purged from the system, check the coolant level again.

Check the DCA4 concentration level

- at least every 6 months,
- at every subsequent oil drain interval if the concentration is above 3.0 units, and
- whenever coolant is added to the cooling system between filter changes.

Use Fleetguard® coolant test kit, CC2626, to check the concentration level. Instructions are included with the test kit.

Refer to Section V, Coolant Recommendations/Specifications, for more information.

Air Compressor Air Cleaner Element (Cummins Two-Cylinder Only)

Replacement

Every 250 hours or 6 months, remove the wing nut which secures the cover to the housing. Remove the cover and the element. Clean the cover and the housing with a clean cloth. Visually inspect air cleaner cover and housing for signs of corrosion. Inspect the rubber gasket on the center bolt. Replace if damaged.

NOTE: Air cleaner cover and housing corrosion can allow debris and unfiltered air to enter the air compressor intake. This will cause premature air compressor failure.

Install a new element, Fleetguard® Part No. AF-251 or Cummins Part No. 256837, in the front cover and assemble over the center bolt. Use your fingers to install and tighten the wing nut.

Replacement - Bendix-Westinghouse Paper Element

Remove the breather cover and element. Clean by reverse flushing with compressed air. Assemble on the compressor. Discard the element if it is damaged or can **not** be cleaned.

Replacement - Bendix-Westinghouse Sponge Element

Remove the breather from the air compressor. Disassemble the breather, wash all metal parts in solvent and blow dry with compressed air. Wash the element in solvent. Remove all solvent from the element. Dip the element in clean engine oil and squeeze excess oil from the element.

Section 6 - Maintenance Procedures Every 1500 Hours or 1 Year

Section Contents

	Page
Crosshead Adjustment Procedure.....	6-17
Crossheads, Valves and Injectors - Adjustment - General Information.....	6-2
General Information.....	6-2
Injector Adjustment Procedures.....	6-4
Injector Adjustment - Dial Indicator Method (For Non-Top Stop Injectors Only)	6-5
Injector Adjustment - Outer Base Circle Method (For NTTA-450 Engines).....	6-15
Injector Adjustment - Top Stop Zero Lash Method (For Non-STC Engines)	6-9
Injector Adjustment - Top Stop Zero Lash Method (For STC Engines).....	6-12
Valve Adjustment Procedure	6-18

General Information

All checks or inspections listed under the previous maintenance intervals **must** also be performed at this time in addition to those listed under this maintenance interval.

Valve and Injector Adjustment Limits		
Top Stop Injector Preload: 0.6 to 0.7 N•m [5 to 6 in-lb]		
	mm	in
Intake Valve	0.28	0.011
Exhaust Valve	0.58	0.023

Crossheads, Valves and Injectors - Adjustment - General Information

Valves and injectors **must** be correctly adjusted for the engine to operate efficiently. Valve and injector adjustment **must** be performed using the values listed in this section.

Adjust the valves and the injectors at each 1500 hours or 1 year interval. Also, check adjustment after any major repair.

Valve and Injector Recheck Limits			
Top Stop Injector Preload: 0.00 to 0.05 mm [0.00 to 0.002 in] Lash			
	mm		in
Intake Valve	0.15	MIN	0.006
	0.41	MAX	0.016
Exhaust Valve	0.46	MIN	0.018
	0.76	MAX	0.030

If valve and injector adjustment is checked during troubleshooting or before the 1500 hours or 1 year scheduled maintenance interval, adjustment is **not** required if measurements are within the recheck limits.

All overhead (crosshead, valve, and injector) adjustments **must** be made when the engine is cold (any stabilized coolant temperature at 60°C [140°F] or below).

NOTE: After an engine rebuild or any major repair where the injector setting **must** be disturbed, set all of the valves and injectors. Once the adjustment procedure has been completed, continue through the crankshaft rotation and check (adjust if necessary) the injector adjustment on cylinders No. 2, No. 3, and No. 6. This takes care of any camshaft and rocker lever shaft deflection which may have occurred during the initial adjustment.

Remove the air crossover connection.
Remove the hose from the crankcase breather.

Remove the rocker housing cover.
Tighten the rocker housing capscrews.
Torque Value: 80 N•m [60 ft-lb]
Alternately tighten the injector hold down capscrews (Non-STC engines only).
Torque Value: 18 N•m [156 in-lb]
Tighten the single injector hold down capscrew (STC engines only).
Torque Value: 45 N•m [35 ft-lb]

The valve set marks are located on the accessory drive pulley. The marks align with a pointer (cast-in or bolt-on, depending on the engine model) on the gear cover.

Warning: Do not pull or pry on the fan to manually rotate the engine. To do so can damage the fan blades. Damaged fan blades can cause premature fan failures which can result in serious personal injury or property damage.

Use the accessory drive shaft to rotate the crankshaft.

The crankshaft rotation is **clockwise** when viewed from the front of the engine.

The cylinders are numbered from the front end of the engine.

The engine firing order is 1-5-3-6-2-4.

Each cylinder has three rocker levers. The rocker lever nearest to the center of the housing is the intake lever.

- The exhaust rocker lever (1).
- The injector rocker lever (2).
- The intake rocker lever (3).

Injector Adjustment Procedures

There are three methods currently used to set valves and injectors on Big Cam NT industrial engines.

- Dial Indicator Method
- Inner Base Circle (IBC) Top Stop - Zero Lash
- Outer Base Circle (OBC)

The dial indicator method is used on non-STC engines equipped with PTD non-top stop injectors. This design of injector does **not** have a plunger top stop cap and, therefore, requires that plunger travel be set in the engine.

The inner base circle top stop-zero lash method is used on engines equipped with PTD fixed time top stop and STC injectors that have plunger top stop caps. This injector design allows the plunger travel to be set in an injector stand outside the engine.

The outer base circle method is used on NTTA-450 engines, CPL 653 or 654, where injector plunger crush is set with the injectors installed in the engine and the plungers bottomed in the injector cups.

The following procedures will explain the three valve and injector adjustment methods.

NOTE: Read the entire procedure for the overhead adjustment before attempting to perform this operation.

Dial Indicator Method		IBC T.S. Zero Lash Method		OBC Method
CPL 0460	CPL 0567	CPL 0523	CPL 1315	CPL 0653* CPL 0654*
CPL 0461	CPL 0573	CPL 0658	CPL 1381	
CPL 0462	CPL 0574	CPL 0702	CPL 1382	
CPL 0463	CPL 0575	CPL 0757	CPL 1383	
CPL 0499	CPL 0582	CPL 0808	CPL 1415	
CPL 0512	CPL 0583	CPL 0908*	CPL 1416	
CPL 0538	CPL 0609	CPL 0909	CPL 1417	
CPL 0539	CPL 0650	CPL 0989*	CPL 1418	
CPL 0540	CPL 0657	CPL 0990*	CPL 1421*	
CPL 0541	CPL 0670	CPL 0991*	CPL 1425	
CPL 0542	CPL 0699	CPL 1183	CPL 1436*	
CPL 0545	CPL 0706	CPL 1193*	CPL 1502	
CPL 0551	CPL 0719	CPL 1194	CPL 1546	
CPL 0552	CPL 0732	CPL 1197	CPL 1557	
CPL 0553	CPL 0733	CPL 1204	CPL 1576	
CPL 0554	CPL 1310	CPL 1252	CPL 1594	
CPL 0566	CPL 1401	CPL 1255	CPL 1600	
		CPL 1314*		

* Note: Use bolt-on MVT pointer bracket for setting the overhead.

Injector Adjustment - Dial Indicator Method (For Non-Top Stop Injectors Only)

The valves and the injectors on the same cylinder are **not** adjusted at the same set mark on the accessory drive pulley.

One pair of valves and one injector are adjusted at each pulley set mark **before** rotating the accessory drive to the next set mark.

Two crankshaft revolutions are required to adjust all the valves and injectors.

Injector and Valve Adjustment Sequence			
Bar Engine in Direction of Rotation	Pulley Position	Set Cylinder Injector	Valve
Start	A	3	5
Advance to	B	6	3
Advance to	C	2	6
Advance to	A	4	2
Advance to	B	1	4
Advance to	C	5	1

Firing Order: 1-5-3-6-2-4

oi100vd

Rotate the accessory drive **clockwise** until the "A" valve set mark on the accessory drive pulley is aligned with the cast-in pointer on the gear cover.

Check the valve rocker levers on cylinder No. 5 to see if both valves are closed.

NOTE: Both valves are closed when both rocker levers are loose and can be moved from side to side. If both valves are **not** closed, rotate the accessory drive one complete revolution; and align the "A" mark with the cast-in pointer again.

If the valve rocker lever adjusting screws have been loosened and **not** yet adjusted, watch the valve push tubes as the engine rolls upon the "A" mark. Both valve push tubes will have moved to the downward (valve closed) position if the engine is on the correct stroke.

Caution: To prevent damage to the indicator or to avoid getting an incorrect reading, install the dial indicator extension so that it clears the rocker lever.

Install the dial indicator and the support from Part No. 3823610, Injector Adjustment Kit, so that the extension for the dial indicator is on top of the injector plunger flange on cylinder No. 3.

Securely tighten the thumb screw (1) and the hold down cap screw (2) in place.

Loosen the thumb screw (3), and lower the indicator against the injector plunger flange until the stem is fully compressed.

Raise the indicator approximately 0.63 mm [0.025-inch], and tighten the thumb screw (3) to hold the indicator in position.

Warning: The injector plunger is under spring tension. Do not allow the tool to slip. Personal injury can result.

Use ST-1193, Rocker Lever Actuator, to depress the injector plunger three or four times to make sure all the oil and fuel have been removed from the injector assembly. Allow the lever to return slowly to prevent damage to the dial indicator.

Actuate the lever again, and set the dial indicator at "0" (zero) while holding the injector plunger to the bottom of its travel.

Slowly release the actuator, and check the indicator travel.

If the indicator travel is **not** at the following specification, proceed to the next step.

Injector Plunger Travel	
mm	in
5.79	0.228

If the indicator travel **is** at the specification, proceed to adjust the valves and crossheads on cylinder No. 5 as described in "Crosshead Adjustment" and "Valve Adjustment" later in this section.

Loosen the lock nut on the injector adjusting screw.

Turn the adjusting screw **clockwise** or **counterclockwise** to adjust the injector plunger to the following dial indicator readings:

Injector Plunger Travel	
mm	in
5.79	0.228

Hold the adjusting screw in this position. The adjusting screw **must not** turn when the lock nut is tightened. Tighten the lock nut to the following torque values:

With Torque Wrench Adapter, 47 N•m [35 ft-lb]
Part No. ST-669

Without Adapter 61 N•m [45 ft-lb]

Warning: The injector plunger is under spring tension. Do not allow the tool to slip. Personal injury can result.

Actuate the injector rocker lever several times. Allow the lever to return slowly to prevent damage to the dial indicator. Hold the injector plunger to the bottom of its travel, and confirm the "0" (zero) reading on the dial indicator.

Allow the injector rocker lever to return slowly. Check the reading on the dial indicator. Repeat the adjusting process if the reading is **not** within specifications.

Adjust the crossheads and the valves on cylinder No. 5 **before** rotating the accessory drive to the next valve set mark. Refer to "Crosshead Adjustment" and "Valve Adjustment" later in this section.

After adjusting the crossheads and the valves on cylinder No. 5, rotate the accessory drive and align the next valve set mark (B) on the accessory drive pulley with the cast-in pointer on the gear cover.

Adjust injector No. 6 and the crossheads and the valves on cylinder No. 3. Follow the Valve and Injector Adjustment Sequence Chart.

Following the Injector and Valve Adjustment Sequence chart, repeat the process to adjust all the injectors, crossheads, and valves correctly.

Injector and Valve Adjustment Sequence			
Bar Engine in Direction of Rotation	Pulley Position	Set Cylinder	
		Injector	Valve
Start	A	3	5
Advance to	B	6	3
Advance to	C	2	6
Advance to	A	4	2
Advance to	B	1	4
Advance to	C	5	1
Firing Order: 1-5-3-6-2-4			

oi100vd

Injector Adjustment - Top Stop Zero Lash Method (For Non-STC Engines)

The adjustment sequence here is identical to the dial indicator method.

The valves and the injectors on the same cylinder are **not** adjusted at the same set mark on the accessory drive pulley.

One pair of valves and one injector are adjusted at each pulley set mark **before** rotating the accessory drive to the next set mark.

Two crankshaft revolutions are required to adjust all the valves and injectors.

Injector and Valve Adjustment Sequence			
Bar Engine in Direction of Rotation	Pulley Position	Set Cylinder	
		Injector	Valve
Start	A	3	5
Advance to	B	6	3
Advance to	C	2	6
Advance to	A	4	2
Advance to	B	1	4
Advance to	C	5	1
Firing Order: 1-5-3-6-2-4			

oi100vd

With this method, the injector plunger travel **must** be set on an injector stand with the injectors removed from the engine.

Caution: Top stop injector plunger travel can only be adjusted when the injectors are removed from the engine. Part No. 3822696, Adjusting Tool, must be used to make this adjustment. Refer to Bulletin No. 3810344 for Top-Stop injectors.

fi8pgue

Rotate the accessory drive **clockwise** until the "A" valve set mark on the accessory drive pulley is aligned with the cast-in pointer.

bc1pulg

Check the valve rocker levers on cylinder No. 5 to see if both valves are closed.

NOTE: Both valves are closed when both rocker levers are loose and can be moved from side to side. If both valves are **not** closed, rotate the accessory drive one complete revolution; and align the "A" mark with the cast-in pointer again.

If the valve rocker lever adjusting screws have been loosened and **not** yet adjusted, watch the valve push tubes as the engine rolls upon the "A" mark. Both valve push tubes will have moved to the downward (valve closed) position if the engine is on the correct stroke.

Loosen the lock nut on the injector adjusting screw on cylinder No. 3. Tighten the adjusting screw until all the clearance is removed between the rocker lever and injector link.

Tighten the adjusting screw one additional turn to correctly seat the link.

Loosen the injector adjusting screw until the injector spring retainer washer touches the top stop screw.

Caution: An overtightened setting on the injector adjusting screw will produce increased stress on the injector train and the camshaft injector lobe which can result in engine damage.

Use torque wrench, Part No. 3376592, to tighten the adjusting screw.

Torque Value: 0.6 to 0.7 N•m [5 to 6 in-lb]

Hold the adjusting screw in this position. The adjusting screw **must not** turn when the lock nut is tightened.

Torque Values:

With torque wrench adapter, Part No. ST-669 47 N•m [35 ft-lb]

Without adapter 61 N•m [45 ft-lb]

Adjust the crossheads and the valves on cylinder No. 5 **before** rotating the accessory drive to the next valve set mark. Refer to "Crosshead Adjustment" and "Valve Adjustment".

After adjusting the crossheads and the valves on cylinder No. 5, rotate the accessory drive and align the next valve set mark (B) on the accessory drive pulley with the cast-in pointer on the gear cover.

Adjust injector No. 6 and the crossheads and the valves on cylinder No. 3.

Repeat the process following the Injector and Valve Adjustment Sequence Chart to adjust all injectors, crossheads, and valves correctly.

Injector and Valve Adjustment Sequence			
Bar Engine in Direction of Rotation	Pulley Position	Set Cylinder Injector Valve	
Start	A	3	5
Advance to	B	6	3
Advance to	C	2	6
Advance to	A	4	2
Advance to	B	1	4
Advance to	C	5	1
Firing Order: 1-5-3-6-2-4			

Injector and Valve Adjustment Sequence			
Bar Engine In Direction of Rotation	Pulley Position	Set Cylinder	
		Injector	Valve
Start	A	3	5
Advance to	B	6	3
Advance to	C	2	6
Advance to	A	4	2
Advance to	B	1	4
Advance to	C	5	1

Firing Order: 1-5-3-6-2-4

oi100vd

Injector Adjustment - Top Stop Zero Lash Method (For STC Engines)

The STC injector preload setting is made at the same injector adjustment position on the accessory drive pulley which is used for the dial indicator method.

Rotate the accessory drive **clockwise** until the "A" valve set mark on the accessory drive pulley is aligned with the cast-in pointer on the gear cover or the bolt-on pointer for the NTA-450 engine.

The NTA-450 engine (CPL 908, 989, 990, 991, 1193, 1314, 1421, 1436) is equipped with a special bolt-on pointer bracket which **must** be aligned with the valve set marks on the accessory drive pulley due to the special camshaft design. The pointer is positioned 40 degrees **clockwise** from the cast-in pointer on the gear cover.

NOTE: Do **not** use the "TC" (top center) mark on the accessory drive pulley in reference with the bolt-on pointer.

Check the valve rocker levers on cylinder No. 5 to see if both valves are closed.

NOTE: Both valves are closed when both rocker levers are loose and can be moved from side to side. If both valves are **not** closed, rotate the accessory drive one complete revolution; and align the "A" mark with the cast-in pointer or the bolt-on pointer again.

If the valve rocker lever adjusting screws have been loosened and **not** yet adjusted, watch the valve push tubes as the engine rolls upon the "A" mark. Both valve push tubes will have moved to the downward (valve closed) position if the engine is on the correct stroke.

Loosen the lock nut on the injector adjusting screw on cylinder No. 3. Tighten the adjusting screw until all the clearance is removed between the rocker lever and injector link.

Tighten the adjusting screw one additional turn to correctly seat the link.

Loosen the injector adjusting screw until the STC tappet touches the top-cap of the injector.

Place STC tappet retaining tool, Part No. 3823348, on the upper surface of the STC injector top-cap. Rotate the tool around the tappet until the tool's locating pin is inserted into one of the four holes in the top of the tappet.

Apply thumb pressure to the tool handle to hold the tappet in the maximum upward position.

Caution: An overtightened setting on the injector adjusting screw will produce increased stress on the injector train and the camshaft injector lobe which can result in engine damage.

While holding the tappet up with the tool, use Part No. 3376592, torque wrench, to tighten the adjusting screw.

Torque Value: 0.6 to 0.7 N•m [5 to 6 in-lb]

NOTE: Apply enough pressure on the tool handle so that the tappet does **not** move downward when the 0.6 to 0.7 N•m [5 to 6 in-lb] torque is applied.

Hold the adjusting screw in this position. The adjusting screws **must not** turn when the lock nut is tightened. Tighten the lock nut to the following torque values:

With torque wrench 47 N•m [35 ft-lb]
adapter, Part No. ST-669

Without Adapter 61 N•m [45 ft-lb]

Remove the tappet retaining tool.

Caution: The tappet tool must be removed before rotating the crankshaft to prevent damage to the tappet and/or tappet retaining tool.

Adjust the crossheads and the valves on cylinder No. 5 **before** rotating the accessory drive to the next valve set mark. Refer to "Crosshead Adjustment" and "Valve Adjustment" later in this section.

After adjusting the crossheads and the valves on cylinder No. 5, rotate the accessory drive and align the next valve set mark (B) on the accessory drive pulley with the cast-in or bolt-on pointer on the gear cover.

Adjust the appropriate crossheads, injector, and the valves following the Injector and Valve Adjustment Sequence Chart.

Repeat the process to adjust all injectors, crossheads, and valves correctly.

Injector and Valve Adjustment Sequence			
Bar Engine in Direction of Rotation	Pulley Position	Set Cylinder	
		Injector	Valve
Start	A	3	5
Advance to	B	6	3
Advance to	C	2	6
Advance to	A	4	2
Advance to	B	1	4
Advance to	C	5	1
Firing Order: 1-5-3-6-2-4			

Injector Adjustment - Outer Base Circle Method (For NTTA-450 Engines)

Rotate the accessory drive in the direction of engine rotation. The accessory drive will rotate **clockwise** on a right hand engine, when looking at the front of the engine. Align the "A" or "1-6VS" mark on the accessory drive pulley with the bolt-on pointer on the gear cover.

NOTE: On the NTTA-450 engine, the camshaft design characteristics necessitate that all six injectors **must** be adjusted first before adjusting the valves. For adjusting crossheads and valves, use the top stop zero lash or IBC sequence and follow the procedures for "Crosshead Adjustment" and "Valve Adjustment" later in this section.

The NTTA-450 engine (CPL 653 and 654) is equipped with a special bolt-on pointer bracket which **must** be aligned with the valve set marks on the accessory drive pulley due to the special camshaft design. The pointer is positioned 40 degrees **clockwise** from the cast-in pointer on the gear cover.

NOTE: Do **not** use the "TC" (top center) mark on the accessory drive pulley in reference with the bolt-on pointer.

Outer Base Circle (OBC) Injector Adjustment Sequence		
Bar Engine In Direction of Rotation	Pulley Position	Set Cylinder Injector
Start	A	1
Advance to	B	5
Advance to	C	3
Advance to	A	6
Advance to	B	2
Advance to	C	4
Firing Order:1-5-3-6-2-4		

Check the valve rocker levers on cylinder No. 1 to see if both valves are closed.

NOTE: Both the intake and exhaust valves are closed when both rocker levers are loose and can be moved from side to side. If both valves are **not** closed, rotate the accessory drive one complete revolution and align the "A" mark with the bolt-on pointer again.

If the valve rocker lever adjusting screws have been loosened and **not** yet adjusted, watch the valve push tubes as the engine rolls upon the "A" mark. Both valve push tubes will have moved to the downward (valve closed) position if the engine is on the correct stroke.

Use a dial type torque wrench to tighten the injector rocker lever adjusting screw to 11 N•m [100 in-lb].

Hold the torque wrench in a position that allows you to look in a direct line at the dial. This is to make sure that you read the dial accurately.

The torque wrench **must** be calibrated, have a resolution of 0.28 N•m [2.5 in-lb], and have a range of 17 N•m [150 in-lb].

On non-brake engines, if the injector adjusting screw is a slotted-head type, be careful that the screw driver does **not** slip out of the slot. These screws can be replaced with hexagon head screws.

Hold the adjusting screw in this position. The adjusting screws **must not** turn when the lock nut is tightened. Tighten the lock nut to the following torque values:

With torque wrench 47 N•m [35 ft-lb]
adapter, Part No. ST-669

Without adapter 61 N•m [45 ft-lb]

Outer Base Circle (OBC) Injector Adjustment Sequence		
Bar Engine In Direction of Rotation	Pulley Position	Set Cylinder Injector
Start	A	1
Advance to	B	5
Advance to	C	3
Advance to	A	6
Advance to B	B	2
Advance to	C	4
Firing Order:1-5-3-6-2-4		

After adjusting the first injector, rotate the accessory drive and align the next injector set mark (B) on the accessory drive pulley with the bolt-on pointer on the gear cover.

Complete this process until all six injectors have been set.

Adjust the crossheads and the valves on the NTTA-450 using the adjustment sequence that is used for dial indicator and top stop zero lash injector adjustment. Refer to "Crosshead Adjustment" and "Valve Adjustment" later in this section.

NOTE: Use the bolt-on pointer on the gear cover when adjusting crossheads and valves on the NTTA-450 engine.

Crosshead Adjustment Procedure

NOTE: Crosshead adjustment **must always** be made before attempting to adjust the valves.

With the "A" valve set mark aligned with the pointer on the gear cover (use bolt-on pointer for NTA-450 and NTTA-450 engines; cast-in pointer otherwise) and both valves closed on cylinder No. 5, loosen the crosshead adjusting screw lock nuts on the intake and the exhaust valve crossheads for cylinder No. 5.

NOTE: Use the following procedure to adjust both the intake and the exhaust crossheads:

Turn the adjusting screw out at least one turn.

Hold the crosshead down against its mating valve stems.

Turn the adjusting screw in until it touches the top of the valve stem but does **not** raise the crosshead.

Hold the adjusting screw in this position. The adjusting screw **must not** turn when the lock nut is tightened to its torque value. Tighten the lock nut. The following torque values are given with and without torque wrench adapter (1), Part No. ST-669:

	Torque Values	
	N•m	ft-lb
With torque wrench adapter, Part No. ST-669 (1)	34	25
Without adapter	41	30

Adjust the intake and the exhaust valves on No. 5 cylinder **before** rotating the accessory drive to the next valve set mark. Refer to "Valve Adjustment Procedure" later in this section.

Valve Adjustment Procedure

With the "A" valve set mark aligned with the pointer on the gear cover (use bolt-on pointer for NTA-450 and NTTA-450 engines; cast-in pointer otherwise) and both valves closed on cylinder No. 5, loosen the lock nuts on the intake and the exhaust valve adjusting screws.

Select a feeler gauge for the correct valve lash specification.

Valve Lash Specifications	
Intake	Exhaust
0.28 mm [0.011-inch]	0.58 mm [0.023-inch]

Insert the feeler gauge between the top of the crosshead and the rocker lever pad.

Two different methods for establishing valve lash clearance are described below. Either method can be used; however, the torque wrench method has proven to be the most consistent. It eliminates the need to feel the drag on the feeler gauge.

- **Torque Wrench Method:** Use the inch pound torque wrench, Part No. 3376592 (normally used to set preload on top stop injectors), and tighten the adjusting screw.

Torque Value: 0.7 N•m [6 in-lb]

- **Feel Method:** Tighten the adjusting screw until a slight drag is felt on the feeler gauge.

Hold the adjusting screw in this position. The adjusting screw **must not** turn when the lock nut is tightened.

Torque Values:

With torque wrench adapter, Part No. ST-669 47 N•m [35 ft-lb]

Without adapter 61 N•m [45 ft-lb]

After tightening the lock nut to the correct torque value, check to make sure the feeler gauge will slide backward and forward between the crosshead and the rocker lever with only a slight drag.

If using the feel method, attempt to insert a feeler gauge that is 0.03 mm [0.001-inch] thicker between the crosshead and the rocker lever pad. The valve lash is **not** correct when a thicker feeler gauge will fit.

After adjusting the crossheads and the valves on cylinder No. 5, rotate the accessory drive and align the next valve set mark with the pointer (bolt-on pointer for NTA-450 and NTTA-450 engines; cast-in pointer otherwise).

Valve Adjustment Sequence		
Bar Engine In Direction of Rotation	Pulley Position	Set Cylinder Valve
Start	A	5
Advance to	B	3
Advance to	C	6
Advance to	A	2
Advance to	B	4
Advance to	C	1
Firing Order:1-5-3-6-2-4		

Adjust the appropriate crossheads and the valves following the Valve Adjustment Sequence Chart.

Repeat the process to adjust all injectors, crossheads, and valves correctly.

NOTE: All engines except the NTTA-450 allow adjustment of valves and injectors concurrently. The NTTA camshaft design characteristics necessitate that all injectors be set first, and then crossheads and valves be set using this procedure.

Install the rocker housing covers. Tighten the capscrews in each cover in the sequence shown.

Torque Value: 20 N•m [15 ft-lb]

Install the crossover connection. Tighten the mounting capscrews.

Torque Value: 34 N•m [25 ft-lb]

Tighten the hose clamps.

Torque Value: 7.9 N•m [70 in-lb]

Install the crankcase breather element, the oil filler cap and hose. Tighten the hose clamp.

Torque Value: 4.5 N•m [40 in-lb]

Section 7 - Annual Maintenance Procedures

Heat Exchanger Zinc Plugs (Marine Only)	7-4
Checking	7-4
Hoses	7-2
Checking and Replacement	7-2
Thermal Aids	7-2
Checking	7-2
Turbocharger Mounting Nuts	7-5
Checking	7-5

General Information

All checks or inspections listed under the previous maintenance intervals **must** also be performed at this time in addition to those listed under this maintenance interval.

Hoses

Checking and Replacement

Annually inspect the cooling system hoses and hose connections for leaks or deterioration. Particles of deteriorated hose can be carried through the cooling system and slow or partially stop circulation.

Engine

Steam or Chemically Clean

Warning: When using a steam cleaner, wear protective clothing and safety glasses or a face shield. Hot steam will cause serious personal injury.

The engine **must** be steam cleaned annually. Steam is the best method of cleaning a dirty engine or a piece of equipment. If steam is **not** available, use a solvent to wash the engine.

Protect all electrical components, openings, and wiring from the full force of the cleaner spray nozzle.

Thermal Aids

Checking

- Oil pan heater

Check for proper operation. Inspect for loose connections, frayed wires, and oil leaks. Repair or replace as needed.

- Block heater

Check for proper operation. Inspect for loose connections, frayed wires, and oil leaks. Repair or replace as needed.

- Engine Pre-heater (Coolant)

Check for proper operation. Inspect for loose connections, frayed wires, and coolant leaks. Clean out the unit of alkali and sludge. Clean the scale from the copper heating element with a wire brush.

Engine Mounting Bolts

Checking

Check the torque on the engine mount nuts and bolts annually. Tighten any that are loose. Refer to the equipment manufacturer for torque specifications. Inspect the rubber for deterioration and age hardening. Replace any broken or lost bolts, capscrews, or damaged rubber.

Crankshaft End Clearance

Checking

Measure the crankshaft end clearance with a dial indicator and make sure it meets the following specifications:

Crankshaft End Clearance Table		
New Minimum	New Maximum	Worn Limit
0.10 mm	0.45 mm	0.56 mm
[0.004 inch]	[0.018 inch]	[0.022 inch]

Caution: Extreme care **MUST** be used in prying against the viscous damper. Sharp pry bars can damage the damper casing, resulting in a leak of the viscous fluid and ultimate failure of the damper.

The check can be made by attaching an indicator to rest against the damper or pulley, while prying against the front cover and inner part of the pulley or damper. End clearance **must** be present with the engine mounted in the unit and assembled to the transmission or converter.

If the clearance is **not** within specifications, contact your Cummins Authorized Repair Location.

Heat Exchanger Zinc Plugs (Marine Only)

Checking

Check the length of all zinc plugs in the heat exchanger and change if they are 50 percent eroded. Frequency of change depends upon the chemical reaction of raw water circulated through the heat exchanger.

Batteries

Checking

If conventional batteries are used, remove the cell caps or covers and check the electrolyte (water and sulfuric acid solution) level.

NOTE: Maintenance-free batteries are sealed and do **not** require the addition of water.

Fill each battery cell with distilled water. Refer to the manufacturer's specifications.

Use the Fleetguard® refractometer, Part No. CC-2800, to check the condition of the battery.

Refer to the battery fluid column in the refractometer to determine the state-of-charge of each battery cell.

Use battery tester, Part No. 3377193, to test the state-of-charge of maintenance-free batteries.

If the state-of-charge is low, use a battery charger to charge the battery. Refer to the manufacturer's instructions.

Replace the battery if it will **not** charge to the manufacturer's specifications or will **not** maintain a charge.

Turbocharger Mounting Nuts

Checking

Check the turbocharger mounting nuts annually.

Tighten the mounting nuts.

Torque Value: 48 N•m [35 ft-lb]

Check the v-band clamps annually. Tighten the clamps:

- Discharge/elbow
- Compressor housing
- Turbine housing

Torque Value: 8 N•m [75 in-lb]

[illegible]

General Information

All checks or inspections listed under the previous maintenance intervals **must** also be performed at this time in addition to those listed under this maintenance interval.

Fuel Pump

Cleaning and Calibration

Every 6,000 hours or 3 years clean and calibrate the fuel pump.

NOTE: This procedure requires special equipment and **must** be done at a Cummins Authorized Repair Location.

Removal

Disconnect the battery cables.

Clean the fuel pump and the surrounding area **before** removing it from the engine.

Disconnect the wires to the fuel shutoff valve.
Disconnect the linkage from the throttle lever.

Disconnect the fuel tubing and air hose.

- Fuel drain (1).
- Gear pump cooling drain (2).
- Gear pump suction line (3).
- AFC air hose (4).
- Fuel supply to injectors (5).
- AFC fuel drain (6).
- Tachometer cable (7).

Remove the four mounting capscrews, and the fuel pump.
Remove the drive coupling (23). Remove and discard the gasket.

Cleaning and Inspection

Clean the fuel pump and the air compressor or accessory drive mounting surfaces.

Inspect the mounting surfaces for damage.

Take the fuel pump to a Cummins Authorized Repair Location for calibration.

Visually inspect the spider coupling for damage.

Installation

NOTE: All NT engines use a white nylon or light green fuel pump drive coupling.

Install the drive coupling (23), gasket, fuel pump, and four capscrews. Tighten the capscrews.

Torque Value: 45 N•m [35 ft-lb].

Connect the fuel tubing and air hose.

- Fuel drain (1).
- Gear pump cooling drain (2).
- Gear pump suction line (3).
- AFC fuel drain (4).
- Fuel supply to the injectors (5).
- AFC air hose (6).
- Tachometer cable (7).

Connect the electric wires to the fuel shutoff valve.

NOTE: The wire connection nut and the ground post nut **must** be clean and tight.

Install the linkage to the throttle lever.

Connect the battery cables.

Operate the engine to normal operating temperature and check for leaks.

Injectors

Cleaning and Calibration

Every 6,000 hours or 3 years clean and calibrate the injectors.

NOTE: This procedure requires special equipment and **must** be done at a Cummins Authorized Repair Location.

Injectors - Replacement

Removal - PTD

To clean and calibrate the injectors, remove them from the engine. The injectors **must** be calibrated on an injector test stand. Refer to Bulletin No. 3379071 - Rebuild Manual; Injectors PT (all types), or Bulletin No. 3810344 - Shop Manual PT (Type D) Top Stop Injector, for rebuild and calibration procedures.

Remove the rocker lever cover assembly.

Loosen the adjusting screw lock nut on each injector rocker lever.

Turn out the adjusting screw on each injector rocker lever.

Move the injector push rods to the side.

Rotate the injector rocker levers up on each cylinder.

Remove the injector link.

Remove the hold down clamp capscrews and the injector hold down clamp.

Caution: Do not drop or damage the injector plunger.

Use Part No. 3376872, Injector Puller, to remove the injectors.

- Take the injectors to a Cummins Authorized Repair Location.

Use a clean wooden stick with a clean cloth wrapped around the end to remove all of the carbon from the injector copper sleeves in the cylinder head.

Caution: Do not use anything metal to scrape the injector copper sleeve.

NOTE: Use ST-1272-11 Chip Removing Unit to remove the carbon from the top of the piston.

Removal - STC

To clean and calibrate the injectors, remove them from the engine. The injectors **must** be calibrated on an injector test stand. Refer to Bulletin No. 3810313 - Shop Manual PT (Type D) Step Timing Control Injector, for rebuild and calibration procedures.

Remove the rocker lever cover assembly.

Loosen the adjusting screw lock nut on each injector rocker lever.

Turn out the adjusting screw on each injector rocker lever.

Loosen the adjusting screw lock nut on each exhaust valve rocker lever.

Turn out the adjusting screw on each exhaust valve rocker lever.

Move the injector and exhaust valve push rods to the side.

Rotate the injector and exhaust valve rocker levers up on each cylinder.

Caution: Do not remove the links from the STC injectors.
Remove the exhaust valve crosshead.

Loosen the injector hold down cap screw.

NOTE: The injector hold down clamp and cap screw **must** be removed with the injector.

Use Part No. 3822697, Injector Puller, to remove the injector.

- Insert the threaded end of the puller into the tapped hole in the STC oil feed lock nut. Remove the injectors.
- Take the injectors to a Cummins Authorized Repair Location.

Caution: Do not use anything metal to scrape the copper injector sleeves.

Use a clean wooden stick with a clean cloth wrapped around the end to remove all the carbon from the copper injector sleeves in the cylinder head.

NOTE: Use ST-1272-11 Chip Removing Unit to remove the carbon from the top of the piston.

Installation - PTD

Install the three new o-rings on each injector.

Lubricate the o-rings with lubricating oil just before installation.

Install the injector in the cylinder head injector bore.

NOTE: The injector **must** be carefully installed by hand. After the injector is in the bore, push firmly down on the injector to start it into the bore.

Use a clean, blunt instrument to seat the injector in the bore.

Caution: Be sure to place the instrument on the body of the injector and not on the plunger or link.

A "snap" will be heard and felt as the injector is seated.

NOTE: Use an air gun to blow the oil from the hold down capscrew holes in the head.

Install the hold down clamp and capscrews over the injector body.

Install the injector link in each injector.

For engines with 5/16 inch - 18 capscrews, tighten the capscrews alternately and evenly, 6 N•m [48 in-lb] torque one at a time.

Torque Value: 17.6 N•m [156 in-lb]

For engines with 3/8 inch - 16 capscrews, tighten the capscrews alternately and evenly, 11 N•m [8 ft-lb] torque one at a time.

Torque Value: 34 N•m [25 ft-lb]

Rotate the injector rocker lever down on each cylinder.

Align the push rods with each injector and exhaust valve rocker lever.

Caution: Do not drop the push rods.

Turn the adjusting screw for the injector rocker lever in until it is properly seated in the push rod socket.

Adjust all crossheads, valves, and injectors. Refer to Section 6.

Install the rocker lever cover.

Installation - STC

Install the three new o-rings on each injector.

Lubricate the o-rings with lubricating oil just before installation.

Install a new o-ring on the STC oil connection block.

Lubricate the o-ring with vegetable oil.

NOTE: Install the grommet and the STC oil connection.

Align the oil hole on the tappet top stop lock nut with the oil supply tube on the STC oil connection block.

NOTE: Use an air gun to blow the oil from the hold down cap screw holes in the head.

Install the injector hold down, hold down cap screw and injector into the cylinder head injector bore.

Install a deep well socket over the top link of the injector. Use a blunt instrument to seat the injector in the bore.

Caution: Be sure to place the instrument on the socket or the body of the injector, not on the plunger or link.

Use the largest socket which will still rest completely on the top surface of the injector.

A "snap" will be heard and felt as the injector is seated.

Tighten the cap screw.

Torque Value: 54 N•m [40 ft-lb]

Install the exhaust valve crosshead.

Rotate the exhaust valve rocker lever down on each cylinder.

Rotate the injector rocker lever down on each cylinder.

Align the push rods with the injector and exhaust valve rocker levers.

Caution: Do not drop the push rods.

Turn the adjusting screw for the injector and exhaust rocker lever in until it is properly seated in the push rod socket.

Adjust all crossheads, valves, and injectors. Refer to Section 6.

Install the rocker housing cover gasket.

Install the rocker lever cover.

Cooling System

Clean System and Replace Antifreeze/Water and DCA

Caution: Do not use caustic cleaners in the cooling system. Aluminum components will be damaged.

Drain and flush the cooling system after 2 years or 6000 hours of service. Refill with new **heavy duty coolant** and install the **correct service coolant filter**.

The cooling system **must** be clean to work correctly and to eliminate buildup of harmful chemicals

Warning: Wait until the temperature is below 50°C [120°F] before removing the coolant system pressure cap. Failure to do so can cause personal injury from heated coolant spray.

NOTE: The performance of RESTORE is dependent on time, temperature, and concentration levels. An extremely scaled or flow restricted system, for example, may require higher concentrations of cleaners, higher temperatures, or longer cleaning times or the use of RESTORE PLUS. RESTORE can be safely used up to twice the recommended concentration levels. RESTORE PLUS **must** be used only at its recommended concentration level. Extremely scaled or fouled systems may require more than one cleaning.

RESTORE	CC2610	(1 gallon)
RESTORE	CC2611	(5 gallons)
RESTORE	CC2612	(55 gallons)
RESTORE PLUS	CC2638	(1 gallon)

NOTE: Engine coolant and RESTORE **must** be disposed of in a responsible manner. Please consult the local environmental agency for recommended disposal guidelines.

Drain the cooling system. Do **not** allow the cooling system to dry out. RESTORE will **not** be as effective if the cooling system is allowed to dry.

Do **not** remove the coolant filter.

NOTE: If the coolant is **not** going to be reused, dispose of used coolant/antifreeze in accordance with federal, state, and local laws and regulations.

Caution: Fleetguard® RESTORE contains no antifreeze. Do not allow the cooling system to freeze during the cleaning operation.

Immediately add 3.8 liters [1 U.S. gallon] of Fleetguard® RESTORE, RESTORE PLUS (or equivalent), for each 38 to 57 liters [10 to 15 gallons] of cooling system capacity, and fill the system with plain water.

Turn the heater temperature switch to high to allow maximum coolant flow through the heater core. The blower does **not** have to be on.

Operate the engine at normal operating temperatures (at least 85°C [185°F]) for 1 to 1 1/2 hours.

Shut the engine off, and drain the cooling system.

Fill the cooling system with clean water to flush the cooling system.

Operate the engine at high idle for 5 minutes with the coolant temperature above 85°C [185°F].

Shut the engine off, and drain the cooling system.

NOTE: If the water being drained is still dirty, the system **must** be flushed again until the water is clean.

Fill the cooling system with heavy duty coolant. Heavy duty coolant is defined as a correct mixture of good quality water, low silicate antifreeze, and supplemental coolant additives (SCA's). Refer to Section V for the correct way to mix up heavy duty coolant. Install the correct service filter. Refer to the DCA4 Service Filter Selection Chart in Section V.

Open the shut-off valve and install the coolant system pressure cap.

Caution: Engine damage will result if the valve is left closed.

Operate the engine until it reaches a temperature of 80°C [180°F], and check for coolant leaks.

Low-silicate antifreeze **must** be mixed with quality water at a 50/50 ratio (40 to 60% working range). A 50/50 mixture of antifreeze and water gives a -34°F freeze point and a boiling point of 228°F, which is adequate for locations in North America. The actual lowest freeze point of ethylene glycol antifreeze is at 68%. Using higher concentrations of antifreeze will raise the freeze point of the solution and increase the possibility of a silicate gel problem.

Refer to Section V for Coolant Recommendations/Specifications.

The Fleetguard® refractometer, Part No. C2800, provides a reliable and easy to read measurement of freeze point protection and glycol (antifreeze) concentration.

The freeze point protection **must** be checked if coolant is added to the cooling system. Refer to the manufacturer's instructions for correct operation.

Using floating ball hydrometers will give incorrect readings.

Fan Hub (Belt Driven)

Inspection

Every 6,000 hours or 2 years inspect the fan hub for the following:

- Freedom of rotation
- Cracks
- Grease seal leakage

Repair or replace the fan hub if the fan hub does **not** rotate freely or if there is evidence of cracks or grease seal leakage.

Refer to the Troubleshooting and Repair Manual for removal and replacement instructions.

Measure the fan hub **end clearance**. Fan hubs with "step-bore" shafts and no bearing spacers **must** be 0.08 mm to 0.25 mm [0.003 inch to 0.010 inch] end clearance.

Fan hubs with "through-bore" shafts with inner and outer bearing spacers **must** be 0.08 mm to 0.41 mm [0.003 inch to 0.016 inch] end clearance.

Replace the fan hub if the end clearance is **not** within these specifications. Refer to the Troubleshooting and Repair Manual for removal and replacement instructions.

Idler Pulley

Inspection

Every 6,000 hours or 2 years inspect the water pump idler pulley assembly for the following:

- Freedom of rotation
- Cracked, chipped or broken pulley grooves.

Repair or replace the idler pulley assembly if it does **not** rotate freely or if damage is found. Refer to the Troubleshooting and Repair Manual for removal and replacement procedures.

Water Pump

Inspection

Every 6,000 hours or 2 years (whichever comes first), visually inspect the water pump body for indications of water leakage at the weep hole. The water pump seal design requires a coolant film for lubrication and cooling. Therefore, it is normal to observe a minor chemical buildup or streaking at the weep hole.

NOTE: A streak or chemical buildup is **not** justification for water pump replacement. If a continuous water leak, i.e., a stream or drip is indicated, replace the water pump with a new or rebuilt unit as necessary. Refer to the Troubleshooting and Repair Manual for removal and replacement instructions.

Turbocharger

Inspection

Inspect the turbocharger every 6,000 hours or 2 years. Remove the air intake and the exhaust piping. Check the turbocharger as follows:

- Look for damaged or cracked compressor or turbine blades. Check to see that the turbocharger shaft spins freely.

NOTE: If visual inspections or dimensional checks indicate a problem, contact a Cummins Authorized Repair Location for assistance. Refer to the model number on the turbocharger dataplate.

Turbocharger Axial and Radial Clearance

Remove the intake and the exhaust piping from the turbocharger.

Use a narrow width feeler gauge to measure the radial clearance (side to side).

NOTE: Hold the shaft toward the feeler gauge to check this dimension.

Rebuild or replace the turbocharger if the radial clearance is greater than specified. Refer to the Troubleshooting and Repair Manual for removal procedures. Refer to the Turbocharger Rebuild Manual for rebuild procedures.

Radial Clearance (Side to Side)		
Turbocharger Model No.	Dimension	
	Minimum	Maximum
BHT3C		
Compressor Impeller	0.18 mm [0.007 in.]	0.46 mm [0.018 in.]
Turbine Wheel	0.25 mm [0.010 in.]	0.53 mm [0.021 in.]

Measure axial clearance (end to end), using dial depth gauge, Part No. ST-537.

Rebuild or replace the turbocharger if axial clearance is greater than specified. Refer to the Troubleshooting and Repair Manual for removal procedures. Refer to the Turbocharger Rebuild Manual for rebuild procedures.

Turbocharger Model No.	Dimension	
	Minimum	Maximum
BHT3C	0.03 mm [0.001 in.]	0.10 mm [0.004 in.]

Air Compressor

Inspection

Complete air compressor inspection is required every 6,000 hours or 2 years.

NOTE: All air compressors have a small amount of oil carryover which lubricates the piston rings and moving parts. When this oil is exposed to normal air compressor operating temperatures over a period of time, it will form varnish or carbon deposits. If the following inspections are **not** done, the air compressor piston rings will be affected by high operating temperatures and pressures, and will **not** seal correctly.

Air Compressor Discharge-Inspection

Drain the air system wet tank to release the system air pressure. Remove the air discharge line from the air compressor.

Measure the total carbon deposit thickness inside the air discharge line as shown. If the total carbon deposit ($X + X$) exceeds 2 mm [1/16 inch], clean and inspect the cylinder head, the valve assembly, and the discharge line. Replace if necessary. Refer to the appropriate Air Equipment Manual listed below for procedures, or contact your Cummins Authorized Repair Location:

- Single Cylinder Air Compressor, Bulletin No. 3810242
- SS338E Single Cylinder Air Compressor, Bulletin No. 3810457
- ST676 Two Cylinder Air Compressor, Bulletin No. 3810257.
- ST773 Two Cylinder Air Compressor, Bulletin No. 3810347.

If the total carbon deposit exceeds specifications, continue checking the air discharge line connections, up to the first tank, until total carbon deposit is less than 2 mm [1/16 inch]. Clean or replace any lines or connections that exceed this specification.

Inspect any air driers, spitter valves, pressure relief valves, alcohol injectors, and the air governor for carbon deposits or malfunctioning parts. Inspect for air leaks. Maintain and repair the parts according to the manufacturer's specifications.

Air Compressor Intake-Inspection

Warning: Hold the unloader valve down when removing the capscrews. Personal injury can result from the sudden release of the spring-loaded unloader valve.

Remove the capscrews, the lock washers, and the flat washers that secure the unloader valve assembly to the cylinder head cover. Remove the unloader valve assembly and the spring from the cylinder head and the cover.

Visually inspect the unloader valve for carbon buildup. If carbon or heavy varnish is present, remove, clean, and inspect the compressor head and the valve assembly. Replace the parts as necessary. Refer to the appropriate Air Equipment Manual listed below for procedures, or contact your nearest Cummins Authorized Repair Location:

- Single Cylinder Air Compressor, Bulletin No. 3810242
- SS338E Single Cylinder Air Compressor, Bulletin No. 3810457
- ST676 Two Cylinder Air Compressor, Bulletin No. 3810257.
- ST773 Two Cylinder Air Compressor, Bulletin No. 3810347.

If the unloader valve is clean or only lightly varnished, install a new o-ring on the unloader body and a new rectangular seal inside the unloader body cavity.

NOTE: The open side of the rectangular seal **must** face the top of the unloader body.

Lubricate the unloader cap with anti-seize compound. Lubricate the unloader body o-ring with engine oil. Assemble the unloader assembly to the cylinder head cover. Tighten the capscrews.

Torque Value: 14 N•m [10 ft-lb]

Warning: Exceeding the torque specifications on these capscrews can permanently distort the compressor cover, causing premature cover gasket leaks.

Vibration Dampers

Viscous Vibration Dampers-Inspection

Caution: The silicone fluid in the damper will become solid after extended service and will make the damper inoperative. An inoperative damper can cause major engine or driveline failures.

Vibration dampers have a limited service life. The damper **must** be replaced after 576,000 km [360,000 miles] or 15,000 hours of service.

NOTE: Do **not** repair or balance a viscous damper in the field.

Check the damper for evidence of fluid loss, dents, and wobble. Visually inspect the vibration damper thickness for any deformation or raising of the damper front cover plate.

If any variations or deformations are detected, refer to the Troubleshooting and Repair Manual for inspection procedures.

Rubber Vibration Dampers-Inspection

NOTE: Vibration dampers have a limited service life. The damper **must** be replaced after 576,000 km, [360,000 miles], or 15,000 hours of service.

Inspect the rubber member for deterioration. If pieces of rubber are missing or if the elastic member is more than 3 mm [1/8 inch] below the metal surface, replace the damper. Refer to the Troubleshooting and Repair Manual for detailed inspection procedures.

Check the alignment of the index marks on the hub and the inertia member. If the marks are more than 1.5 mm [1/16 inch] out of alignment, the damper **must** be replaced.

This image shows a single sheet of white paper with horizontal ruling lines. The lines are evenly spaced and run across the width of the page. There are no margins, text, or other markings on the paper.

Section 9 - Other Maintenance Procedures

Section Contents

Troubleshooting Guide for the Operator

Warning: Performing troubleshooting procedures not outlined in this section can result in equipment damage or personal injury. Consult a Cummins Authorized Repair Location for diagnosis and repair beyond that which is outlined and for symptoms not listed in this section. Before beginning any troubleshooting, please refer to General Safety Instructions in Section i of this manual.

This guide describes some typical engine operating problems, their causes, and some acceptable corrections to those problems. For more procedure information, refer to the Troubleshooting and Repair Manual. Unless noted otherwise, the problems listed are those which an operator can diagnose and repair.

Follow the suggestions below for troubleshooting:

- Study the problem thoroughly before acting.
- Refer to the engine system diagrams.
- Do the easiest and most logical things first.
- Find and correct the cause of the problem.

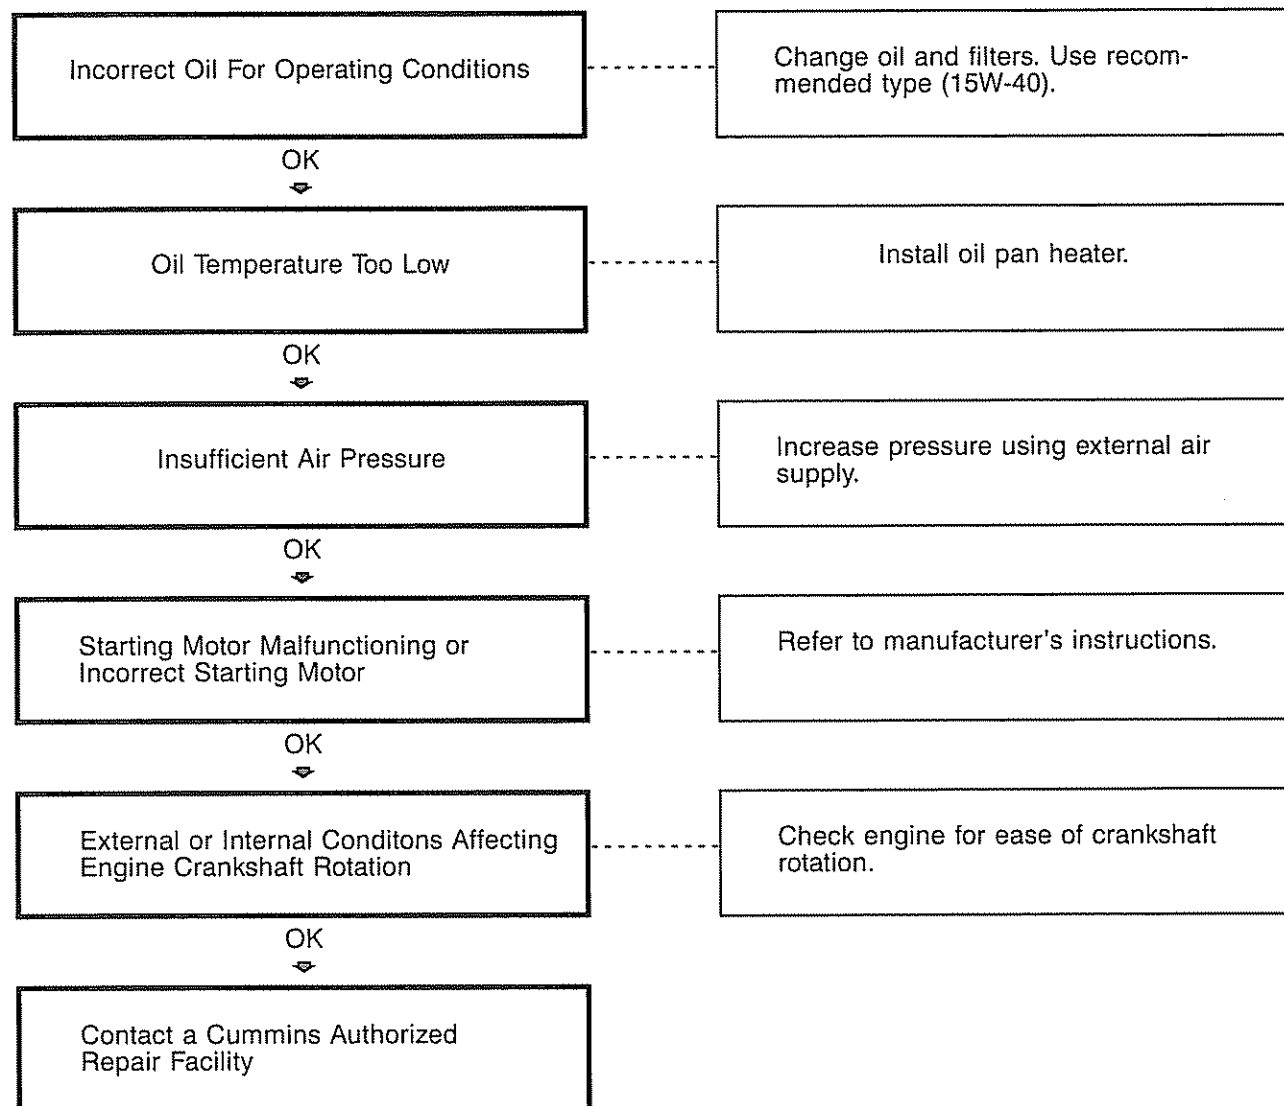

Instructions

Read each row of blocks from top to bottom. Follow the arrows through the chart to identify corrective action.

Engine Will Not Crank or Cranks Slowly (Air Starter)

Cause

Corrections

Engine Will Not Crank or Cranks Slowly (Electric Starter)

Cause

Corrections

Incorrect Oil

Change oil and filters. Use recommended type (15W-40).

OK

Oil Temperature Low

Install oil pan heater.

OK

Battery Rating Too Low

Replace with correct rating.

OK

Battery Temperature Too Low

Check battery heater operation.

OK

External or Internal Conditions Affecting Engine Crankshaft Rotation

Check engine for ease of crankshaft rotation.

OK

Battery Connections Broken, Loose or Corroded

Check battery connections.

OK

Battery Charge Low

Check electrolyte level and specific gravity.

OK

Starting Circuit Component Malfunction

Check starting circuit components.

OK

Contact a Cummins Authorized Repair Facility

Engine Hard to Start or Will Not Start (Exhaust Smoke Present)

Cause	Corrections
Engine Cranking Speed Low (Below 150 RPM)	Check engine cranking RPM.
OK ↓	
Engine Driven Units Engaged	Disengage engine driven units.
OK ↓	
Cold Start Aid Needed or Not Working Correctly	Install cold start aid. Check, repair, or replace if necessary.
OK ↓	
Fuel Filter Plugged	Replace fuel filter.
OK ↓	
Air in the Fuel System	Check for air in fuel, tighten fuel connections and filter, check fuel tank stand pipe.
OK ↓	
Fuel Suction Line Restricted	Check fuel line for restrictions.
OK ↓	
Intake Air System Restricted	Check intake air system for restrictions.
OK ↓	
Fuel Contaminated	Verify by operating engine from a temporary supply tank.
OK ↓	
Contact a Cummins Authorized Repair Facility	

Engine Cranks But Will Not Start (No Smoke From Exhaust)

Cause

Corrections

No Fuel In Tank

Add fuel.

OK

Shut-off Valve Closed

Use manual override. Repair electrics.

OK

No Fuel To Injectors

Loosen fuel supply line between fuel pump and cylinder head while cranking engine - check for fuel.

OK

Fuel Connections Loose On Suction Side Of Fuel Pump

Tighten all fuel filter fittings and connections from fuel tank to fuel pump.

OK

Fuel Filter Plugged or Suction Line Restricted

Replace fuel filter. Inspect fuel hose for restriction.

OK

No Fuel in Pump

Prime fuel pump.

OK

Intake or Exhaust System Restricted

Check intake and exhaust system for restrictions.

OK

Contact a Cummins Authorized Repair Facility

Engine Starts But Will Not Keep Running

Cause

Corrections

Air In The Fuel System

Check for air in fuel, tighten fuel connections, tighten filter, check fuel tank stand pipe.

OK

Engine Driven Units Engaged

Disengage engine driven units.

OK

Fuel Filter Plugged or Fuel Waxing
Due to Cold Weather

Replace fuel filter. Weather conditions can require fuel heater.

OK

Fuel Suction Line Restricted

Inspect fuel line for restriction.

OK

Fuel Contaminated

Verify by operating engine from a temporary supply tank.

OK

Contact a Cummins Authorized
Repair Facility

Oil Filter Plugging - Low Oil Pressure Light On

Cause

Corrections

Oil Level Incorrect

Oil level must be between the high mark and low mark. Check dipstick calibration.

OK

Oil Filter Restricted

Check oil pressure. If within specifications, change full flow filter.

OK

Oil Dilution or Improper Viscosity Oil

Change oil and find source of dilution.

OK

Electrical Short in Low/High Oil Pressure Filter Alarm

Check wiring to light.

OK

Oil Temperature Above Normal (120°C [250°F]).

Refer to "Coolant Temperature Above Normal" chart.

OK

Contact a Cummins Authorized Repair Facility

Coolant Temperature Above Normal

Cause	Corrections
Low Coolant Level	Add coolant.
OK ↓	
Radiator Fins Damaged or Obstructed with Debris	Inspect radiator fins. Clean or repair if necessary.
OK ↓	
Collapsed or Restricted Radiator Hose	Inspect hoses. Replace if necessary.
OK ↓	
Loose Fan Drive Belt	Check belt tension and tighten if necessary.
OK ↓	
Incorrect Oil Level	Add or drain engine oil. Check dipstick calibration.
OK ↓	
Cooling Fan Shroud Damaged or Missing	Inspect shroud. Repair, replace, or install.
OK ↓	
Incorrect or Malfunctioning Radiator Cap	Check the radiator cap. Replace if necessary.
OK ↓	
Temperature Gauge Malfunctioning	Test the gauge. Repair or replace if necessary.
OK ↓	

(Continued)

Coolant Temperature Above Normal (Continued)

Cause

Corrections

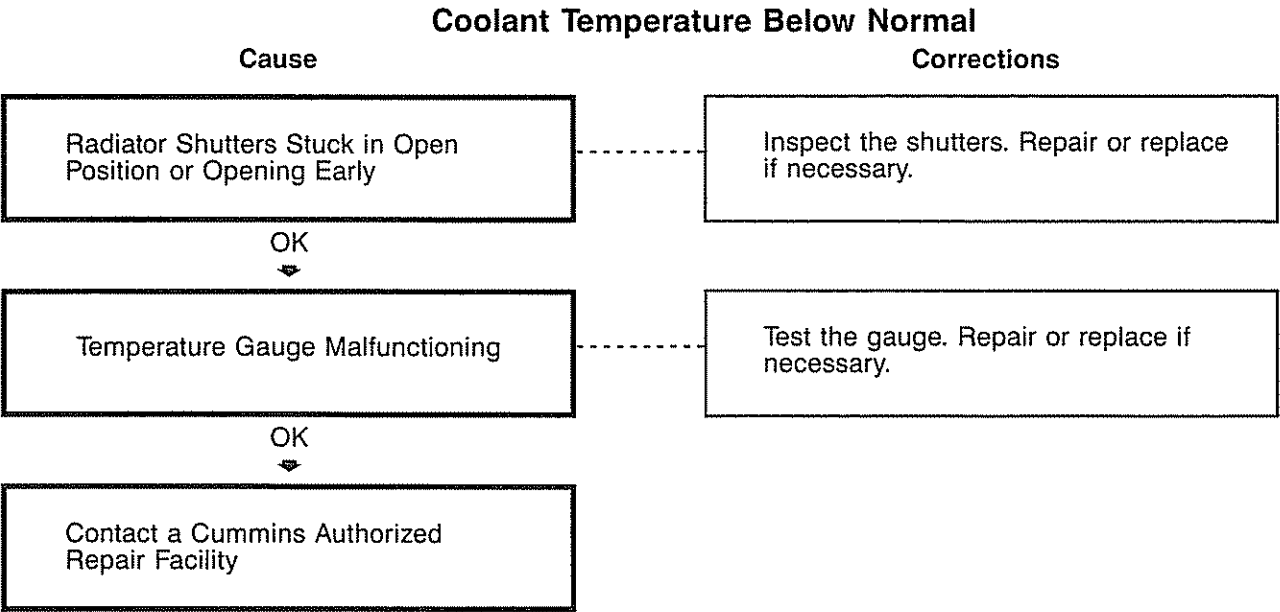

Radiator Shutters are not Opening
Completely or Cold Weather Radiator
Cover Closed

Inspect the shutters. Repair or replace
if necessary. Open radiator cover.

OK

Contact a Cummins Authorized
Repair Facility

Exhaust Smoke Excessive Under Load

Cause

Corrections

Intake Air System Restricted

Check intake air system for restrictions.

OK
↓

Intake Air Leaks Between Turbocharger
and Cylinder Head

Check for air leaks.

OK
↓

Fuel Specifications Wrong

Check fuel specifications. Refer to
Section V.

OK
↓

Valves or Injector Adjusted Wrong

Check/adjust valves or injectors. Refer
to Section 6.

OK
↓

Fuel Drain Line Restricted

Inspect fuel return system for loops,
crimps, or clamped points.

OK
↓

Contact a Cummins Authorized
Repair Facility

Engine Power Output Low

Cause	Corrections
Excessive Load for Engine Horsepower Rating	Reduce vehicle load.
OK ↓	
Low Power Due to Altitude	Derate engine above 3600 meters [12,000 feet].
OK ↓	
Fuel Suction Line or Fuel Filter Restricted	Check fuel line for restriction. Replace fuel filter.
OK ↓	
Lubricating Oil Level Too High	Check dipstick calibration and oil pan capacity.
OK ↓	
Throttle Linkage Adjustment Wrong	Check throttle linkage adjustment for full opening of throttle lever.
OK ↓	
Intake or Exhaust System Restricted	Check intake and exhaust systems for restrictions.
OK ↓	
Air in Fuel - Spongy Throttle is Symptom	Check for air in fuel, tighten fuel connections and filter, check fuel tank stand pipe.
OK ↓	

(Continued)

Engine Power Output Low (Continued)

Cause

Corrections

Fuel Drain Line Restricted or Fuel Tank Vents Plugged

Check fuel drain line for loops, crimps or clamped points. Remove, clean, or replace vents.

OK

Valves or Injectors Adjusted Wrong

Check/adjust valves or injectors. Refer to Section 6.

OK

Fuel Quality Poor

Verify by operating engine from a temporary tank that contains good fuel. Refer to fuel specifications in Section V.

OK

High Intake Air Temperature - (Above 38°C [100°F])

Use outside air to turbocharger in warm weather.

OK

Low Intake Air Temperature - (Below 0°C [32°F])

Use intake air from under hood in cold weather.

OK

High Fuel Temperatures - (Above 70°C [158°F])

Fill fuel tanks; turn off fuel heater. Maximum fuel temperature 70°C [158°F].

OK

Contact a Cummins Authorized Repair Facility

Engine Will Not Reach Rated Speed When Loaded

Cause

Corrections

Excessive Load for Engine Horsepower Rating

Reduce vehicle load or use lower gear.

OK

Tachometer Has a Malfunction

Check with hand or digital tachometer.

OK

Throttle Linkage Adjustment Wrong

Check for full throttle travel.

OK

Fuel Suction Line Restricted

Check fuel inlet for restriction.

OK

Contact a Cummins Authorized Repair Facility

White Smoke or Rough Running At Idle (After Warmup Period)

Cause

Corrections

Low Coolant Temperature

Refer to "Coolant Temperature Below Normal" chart.

OK

Fuel Quality Poor

Verify by operating engine from a temporary tank that contains good fuel.

OK

Air Starting Motors

The air starting motor system (tanks, line sizes, and valves) is designed and installed by the original equipment manufacturers and the starting motor suppliers. Refer any questions about the air starting systems to the manufacturer.

Maintenance

- Do **not** operate the air starting motor with air pressure lower than 480 kPa [70 psi].
- Maintain the air starting motor according to the manufacturer's recommendations.
- For maximum efficiency, the hoses, tubes, and lines **must not** leak.
- Refer to the original equipment manufacturers' and starting motor manufacturers' manuals for specific information regarding the starting motors, valves, and systems.

Battery Connections

Parallel and Series Connections

Caution: To avoid electrical shock and potential eye danger when using jumper cables to start the engine, make sure to connect the cables in parallel: positive (+) to positive (+) and negative (-) to negative (-). When using an external electrical source to start the engine, turn the disconnect switch to the OFF position and remove the key before attaching the jumper cables.

The accompanying illustration shows a typical **parallel** battery connection. This arrangement doubles the cranking amperage.

This illustration shows a typical **series** battery connection. This arrangement, positive to negative, doubles the voltage.

For optimum electrical system and starting motor performance, keep battery connections clean and tight.

Belts - General Inspection

Visually inspect the belts. Replace belts that are cracked or frayed. Adjust belts that have a glazed or shiny surface which indicates belt slippage. Correctly installed and tensioned belts will show even pulley and belt wear.

Belt damage can be caused by:

- Incorrect tension
- Incorrect size or length
- Pulley misalignment
- Incorrect installation
- Severe operating environment
- Oil or grease on belts

Belt Tension

Checking

Measure the belt tension in the center span of the pulleys.

Refer to the Belt Tension Chart in Section V for the correct gauge and tension value for the belt width used.

An alternate method (deflection method) can be used to check belt tension by applying 110 N [25 lbf] force between the pulleys on v-belts. If the deflection is more than one (1) belt thickness per foot of pulley center distance, the belt tension **must** be adjusted.

For cogged belts, make sure that the belt tension gauge is positioned so that the center tensioning leg is placed directly over the high point (hump) of a cog. Other positioning will result in incorrect measurement.

Fan Drive Belt

Adjustment

Loosen the four capscrews which secure the fan hub shaft to the bracket.

NOTE: Do **not** adjust belt tension to full value with the adjusting screw. Belt tension can increase when the lock nut is tightened and, therefore, reduce belt and bearing life.

Turn the adjusting screw to increase belt tension.

Measure the belt tension.

Refer to the Belt Tension Chart in Section V to select the correct gauge and tension values.

For cogged belts, make sure the belt tension gauge is positioned so that the center tensioning leg is placed directly over the high point (hump) of a cog. Other positioning will result in incorrect measurement.

Tighten the four capscrews until the fan hub is in correct alignment with the fan hub bracket.

NOTE: Do **not** tighten the capscrews to full torque value.

Measure the belt tension.

Tighten the four capscrews.

Torque Value: 110 N•m [80 ft-lb]

Measure the belt tension again. Adjust if necessary.

Loosen the adjusting screw 1/2 turn to prevent breakage.

Water Pump Belt - Adjustment (Inside Idler Pulley)

Loosen the lock nut which secures the idler pulley to the water pump.

Turn the adjusting screw to adjust the belt tension.

NOTE: Do **not** adjust belt tension to full value with the adjusting screw. Belt tension can increase when the lock nut is tightened and, therefore, reduce belt and bearing life.

Secure the idler pulley in position by tightening the lock nut.

Torque Value: 70 N•m [50 ft-lb]

Loosen the adjusting screw 1/2 turn to prevent breakage.

Measure the belt tension again. Adjust if necessary.

Alternator Drive Belt

Adjustment

- Loosen the adjustment link locking capscrew and alternator pivot bolt.
- Turn the adjusting screw to adjust belt tension. Refer to the Belt Tension Chart in Section V for correct tension value.
- Tighten the adjustment link locking capscrew and alternator pivot bolt.

Torque Value: 80 N•m [60 ft-lb]

Drive Belts

Replacement

NOTE: When a drive uses two or more belts, replace the belts as a complete set.

Loosen the adjusting mechanism, and move the pulley centers as close as possible. The belts can then be installed without excessive force.

To prevent damage, do **not** roll a belt over the pulley or pry it on with a tool.

Refer to the Belt Tension Chart in Section V to select the correct gauge and tension value for the belt width.

Pulley misalignment **must not** exceed 6 mm for each meter [1/16-inch for each 12 inches] of distance between the pulley centers.

Belts **must not** touch the bottom of the pulley grooves, nor **must** they protrude over 3 mm [3/32-inch] above the top edge of the groove.

When a drive uses two or more belts, the belt riding depth **must not** vary over 2 mm [1/16-inch] between belts.

Storage for Engines Out of Service

If the engine will be out of service longer than 6 months, take special precautions to prevent rust. Contact the nearest Cummins Authorized Repair Location, or refer to the Engine Shop Manual, Bulletin No. 3379076, for information concerning engine storage procedures.

General Specifications

Metric [U.S. Customary]

NOTE: Listed below are general specifications for this engine. Refer to each System Section for additional specifications.

Engine Speed Refer to the engine dataplate for optional speed rating.

Displacement 14.0 liters [855 C.I.D.]

Bore and stroke 140 mm [5.5 in] x 152 mm [6.0 in]

Engine Weight

Dry 1303 kg [2870 lbs] to 1330 kg [2930 lbs]

Wet 1348 kg [2970 lbs] to 1376 kg [3030 lbs]

Firing order 1-5-3-6-2-4

Valve and injector settings:

Intake valve adjustment 0.28 mm [0.011 in]

Intake valve limits 0.15 to 0.41 mm [0.006 to 0.016 in]

Exhaust valve adjustment 0.58 mm [0.023 in]

Exhaust valve limits 0.46 to 0.76 mm [0.018 to 0.030 in]

Top Stop injector adjustment (in engine) 0.6 to 0.7 N•m [5 to 6 in-lb]

Top Stop injector recheck limits 0.00 to 0.05 mm [0.000 to 0.002 in lash]

STC Top Stop injector adjustment (in engine) 0.6 to 0.7 N•m [5 to 6 in-lb]

STC Top Stop injector recheck limits 0.00 to 0.05 mm [0.000 to 0.002 in lash]

Fuel System

NOTE: For performance and fuel rate values, refer to the engine data sheet, or the fuel pump code for the particular model involved.

Maximum Allowable Restriction to Pump:

- With Clean Filter 100 mm Hg [4 in Hg]
- With Dirty Filter 200 mm Hg [8 in Hg]

Maximum Allowable Return Line Restriction 63 mm Hg [2.5 in Hg]

Maximum Allowable Return Line Restriction
with Check Valves and/or Overhead Tanks 165 mm Hg [6.5 in Hg]

Minimum Allowable Fuel Tank Vent Capability 0.85 m³/h [30 ft³/hr]

Lubricating Oil System

Oil Pressure

Oil Pressure, Main Oil Rifle (15W40 oil at 107°C [225°F]):

- At idle (minimum allowable) 70 kPa [10 psi]
- At no load governed speed 240 to 310 kPa [35 to 45 psi]

Oil Filter Capacity

- Bypass filter (spin-on) (LF777) 2.65 liters [0.7 U.S. gal]
- Full flow filter (spin-on) (LF670) 2.65 liters [0.7 U.S. gal]
- Combination filter (LF3000) 2.65 liters [0.7 U.S. gal]

Oil Pan Capacity:

- G-Drive28.4 to 36 liters [7.5 to 9.5 U.S. gal.]
- Other applications26 to 34 liters [7.0 to 9.0 U.S. gal.]

Total System Capacity

Total system capacity is the summation of the oil pan capacity at the high mark on the dipstick, the full flow oil filter capacity, and the capacity of any bypass filters that are used.

Cooling System

Coolant capacity (Engine only)	
NTA855	21 liters [22 U.S. qts.]
NT855	19 liters [20 U.S. qts.]
Standard modulating thermostat-range	79° to 91°C [175° to 195°F]
Maximum coolant pressure (pressure cap removed)	241 kPa [35 psi]
Maximum allowable top tank temperature	95°C [203°F]
Minimum recommended top tank temperature	
Construction/Industrial	100°C [212°F]
G-Drive	104°C [220°F]
Maximum allowable deaeration time	25 minutes
Minimum allowable drawdown or 20% of system capacity (whichever is greater)	10.4 liters [11 U.S. qts.]
Minimum allowable pressure cap	48 kPa [7 psi]

Air Intake System

NOTE: Engine intake air **must** be filtered to prevent dirt and debris from entering the engine. If intake air piping is damaged or loose, unfiltered air will enter the engine and cause premature wear.

Metric [U.S. Customary]

Maximum Intake restriction:	
Clean air filter element	
Normal duty air cleaner	254 mm H ₂ O [10.0 in H ₂ O]
Heavy duty air cleaner	381 mm H ₂ O [15.0 in H ₂ O]
Dirty air filter element	635 mm H ₂ O [25.0 in H ₂ O]

Exhaust System

Maximum back pressure	75 mm Hg [3.0 in Hg]
Normal exhaust pipe diameter	127 mm [5 inches]

Compressed Air System

Single Cylinder Air Compressor

Cylinders	1	
Compressor Capacity @ 1250 RPM	6.2 L per sec. [13.20 CFM]	
Piston Displacement	296 C.C. [18.6 C.I.]	
Bore	92.08 mm [3.625 inch] stroke	44.45 mm [1.750 in]
Speed	Engine Speed	
Cooling	Engine Coolant	
Lubrication	Engine Lubricating Oil	
Plumbing Line Sizes:		
Coolant Inlet and Outlet (Pipe Fitting)	9.53 mm NPTF [0.375 inch NPTF]	
Air Inlet (Inside Diameter)	22.22 mm [0.875 in]	
Air Outlet (Minimum Inside Diameter)	12.7 mm [0.50 in]	
Height, Overall (approximate)	31.1 cm [12.25 in]	
Width, Overall (approximate)	14.6 cm [5.75 in]	
Length, Overall (approximate)	22.9 cm [9.00 in]	
Weight (approximate)	18 Kg [40.0 lbs]	

Two Cylinder Air Compressor

Cylinders	2
Compressor Capacity @ 1250 RPM	14.2 L per sec. [30.00 CFM]
Piston Displacement	676 C.C. [41.3 C.I.]
Bore	92.08 mm [3.625 in]
Stroke	50.8 mm [2.00 in]
Speed	Engine Speed
Cooling	Engine Cooling
Lubrication	Engine Lubricating Oil
Plumbing Line Sizes:	
Coolant Inlet and Outlet (Pipe Fitting)	9.53 mm NPTF [0.375 inch NPTF]
Air Inlet (Inside Diameter)	22.22 mm [0.875 in]
Air Outlet (Minimum Inside Diameter)	15.88 mm [0.625 in]
Height, Overall (approximate)	34.3 cm [13.50 in]
Width, Overall (approximate)	17.8 cm [7.00 in]
Length, Overall (approximate)	28.7 cm [11.30 in]
Weight (approximate)	33.5 Kg [74.50 lbs]

Electrical System

Minimum battery capacity @ -18 to 0°C [0 to 32°F] ambient temperature

12-volt starter 400 ampere hour	1800 cold cranking amps @ -18°C [0°F]
24-volt starter 200 ampere hour	900 cold cranking amps @ -18°C [0°F]

Minimum battery capacity above 0°C [32°F] ambient temperature

12-volt starter 300 ampere hour	1280 cold cranking amps @ -18°C [0°F]
24-volt starter 150 ampere hour	640 cold cranking amps @ -18°C [0°F]

Maximum starting circuit resistance

12-volt starter	0.00075 ohms
24-volt starter	0.00200 ohms

Battery cable sizes - American wire gauge (Maximum length in cranking motor circuit)

12-volt	
No. 00	3.7 meters [12 ft]
No. 000	4.9 meters [16 ft]
No. 0000 or two No. 0*	6.1 meters [20 ft]
Two No. 00	7.6 meters [25 ft]

12-volt High Output

No. 00	2.1 meters [7 ft]
No. 000	2.7 meters [9 ft]
No. 0000 or two No. 0*	3.7 meters [12 ft]
Two No. 00	4.3 meters [14 ft]

24 to 32-volt

No. 00	6.1 meters [20 ft]
No. 000	8.2 meters [27 ft]
No. 0000 or two No. 0*	10.7 meters [35 ft]
Two No. 00	13.7 meters [45 ft]

Minimum ambient temperature without starting aid Refer to engine data sheet.

Minimum cranking speed without starting aid 100 RPM

* Two strands of No. 0 cable can be used in place of one No. 0000 cable providing all connections are carefully made to ensure equal current flow in each parallel cable.

Minimum Recommended Battery Capacity

System Voltage	Ambient Temperature			
	-18°C [0°F]		0°C [32°F]	
	Cold Cranking Amperes	Reserve Capacity*	Cold Cranking Amperes	Reserve Capacity*
12 Volt	1800	640	1280	480
24 Volt**	900	320	640	240

* Note: The number of plates within a given battery size determines reserve capacity. Reserve capacity determines the length of time sustained cranking can occur.

** CCA ratings are based on two, 12 volt batteries in series.

Batteries (Specific Gravity)

Battery State of Charge	Specific Gravity @ 27°C [80°F]
100%	1.260-1.280
75%	1.230-1.250
50%	1.200-1.190
25%	1.170-1.190
Discharged	1.110-1.130

Fuel Recommendations/Specifications

Warning: Do NOT mix gasoline or alcohol with diesel fuel. This mixture can cause an explosion.

Cummins Engine Company, Inc. recommends the use of ASTM No. 2 D fuel. The use of No. 2 diesel fuel will result in optimum engine performance. At operating temperatures below 0°C [32°F], acceptable performance can be obtained by using blends of No. 2 D and No. 1 D. The use of lighter fuels can reduce fuel economy.

The viscosity of the fuel **must** be kept above 1.3 cSt at 100°C [212°F] to provide adequate fuel system lubrication.

For a more detailed description of fuel properties, refer to Fuel For Cummins Engines, Bulletin No. 3379001. See ordering information in the back of this manual.

Lubricating Oil Recommendations/Specifications

The use of high quality engine lubricating oils combined with appropriate oil drain and filter change intervals is a critical factor in maintaining engine performance and obtaining maximum engine life.

Cummins Engine Company, Inc. strongly recommends the use of a high quality SAE 15W-40 heavy duty engine oil (such as Cummins Premium Blue) which meets the American Petroleum Institute (API) performance classification CE or CF-4.

NOTE: CD or CD/SF engine oils can be used in areas where CE and CF-4 oil is **not** yet available.

A sulfated ash content of 1.0 mass percent will yield optimal control of valve and piston deposit and will minimize oil consumption. The sulfated ash **must not** exceed 1.85 percent mass.

For further details and discussion of engine lubricating oils for Cummins engines, refer to Bulletin No. 3810340, Cummins Engine Oil Recommendations, and Bulletin No. 3810375, Use of CE Engine Oils in Cummins Engines.

Additional information regarding lubricating oil availability throughout the world is available in the E.M.A. Lubricating Oils Data Book for Heavy Duty Automotive and Industrial Engines. The data book can be ordered from the Engine Manufacturers Association, One Illinois Center, 111 East Wacker Drive, Chicago, IL U.S.A. 60601. The telephone number is: (312) 644-6610.

The API service symbols are shown in the accompanying illustration. The upper half of the symbol displays the appropriate oil categories; the lower half can contain words to describe oil energy conserving features. The center section identifies the SAE oil viscosity grade.

Caution: The use of low viscosity oils, such as 10W or 10W-30, can be used to aid in starting the engine and in providing sufficient oil flow at ambient temperatures below -5°C [23°F]. Continuous use of low viscosity oils can decrease engine life due to wear.

Arctic Operation

If an engine is operated in ambient temperatures consistently below -23°C [-10°F] and there are no provisions to keep the engine warm when it is **not** in operation, use a synthetic CE/SF engine oil with adequate low temperature properties such as 5W-20 or 5W-30.

The oil supplier **must** be responsible for meeting the performance service specifications.

Caution: The use of a synthetic base oil does not justify extended oil change intervals. Extended oil change intervals can decrease engine life due to factors such as corrosion, deposits, and wear.

New Engine Break-In Oils

Special "break-in" engine lubricating oils are **not** recommended for new or rebuilt Cummins engines. Use the same type oil during the "break-in" as that which is used in normal operation.

Caution: A sulfated ash limit of 1.85 percent has been placed on all engine lubricating oils recommended for use in Cummins engines. High ash oils can cause valve and/or piston damage and lead to excessive oil consumption.

Additional information regarding lubricating oil availability throughout the world is available in the E.M.A. Lubricating Oils Data Book for Heavy Duty Automotive and Industrial Engines. The data book can be ordered from the Engine Manufacturers Association, One Illinois Center, 111 East Wacker Drive, Chicago, IL U.S.A. 60601. The telephone number is: (312) 644-6610.

Oil Change Interval

As the engine oil becomes contaminated, essential oil additives are depleted. Lubricating oils protect the engine as long as these additives are functioning properly. Progressive contamination of the oil between oil and filter change intervals is normal. The amount of contamination will vary depending on the operation of the engine, hours or miles on the oil, fuel consumed, and new oil added.

Extending the oil and filter change intervals beyond the recommendations will decrease engine life due to factors such as corrosion, deposits, and wear.

Refer to the chart on the next page to determine which oil drain interval to use for your application.

Is your vehicle used in a Construction, Mining or Logging Application?	YES	<p>Use the following oil drain intervals for your application (1):</p> <table border="1"> <thead> <tr> <th>Vehicle/Equip</th> <th>KM</th> <th>MILES</th> <th>HRS</th> <th>MOS</th> </tr> </thead> <tbody> <tr> <td>Truck Crane</td> <td>10,000</td> <td>6,000</td> <td>250</td> <td>6</td> </tr> <tr> <td>Logging Truck</td> <td>16,000</td> <td>10,000</td> <td>250</td> <td>6</td> </tr> <tr> <td>Mining Truck</td> <td>N/A</td> <td>N/A</td> <td>250</td> <td>6</td> </tr> <tr> <td>Cranes</td> <td>N/A</td> <td>N/A</td> <td>250</td> <td>6</td> </tr> <tr> <td>Backhoe</td> <td>N/A</td> <td>N/A</td> <td>250</td> <td>6</td> </tr> <tr> <td>Dozer</td> <td>N/A</td> <td>N/A</td> <td>250</td> <td>6</td> </tr> <tr> <td>Scraper</td> <td>N/A</td> <td>N/A</td> <td>250</td> <td>6</td> </tr> <tr> <td>Skidder</td> <td>N/A</td> <td>N/A</td> <td>250</td> <td>6</td> </tr> </tbody> </table>	Vehicle/Equip	KM	MILES	HRS	MOS	Truck Crane	10,000	6,000	250	6	Logging Truck	16,000	10,000	250	6	Mining Truck	N/A	N/A	250	6	Cranes	N/A	N/A	250	6	Backhoe	N/A	N/A	250	6	Dozer	N/A	N/A	250	6	Scraper	N/A	N/A	250	6	Skidder	N/A	N/A	250	6

Lubricating Oil Filter Specifications

Cummins Engine Company, Inc. requires a lubricating oil filter(s) be used that meets the specifications given in the table below.

Lubricating Oil Filter Specifications			
Per Cummins Source Approval Method (SAM)	Combo (LF3000) 10,634	Full Flow (LF670) 10,509	Bypass (LF777) 10,547
Flow vs. Restriction			
• Pressure differential at 40 GPM maximum	21 kPa [3 psi]	21 kPa [3 psi]	N/A
Element Collapse			
• Pressure differential	1034 kPa [150 psi]	1034 kPa [150 psi]	1034 kPa [150 psi]
Partical Retention			
• Absolute retention, percent of 40 micrometre and above, minimum	N/A	100%	N/A
• Percent retention of 20 to 30 micrometre	N/A	95%	N/A
Hydrostatic Pressure			
• Pressure, minimum	1724 kPa [250 psi]	1724 kPa [250 psi]	1724 kPa [250 psi]

Coolant Recommendations/Specifications

Heavy duty diesel engines require a "heavy duty coolant". Heavy duty coolant is defined as a correct mixture of good quality water, low silicate antifreeze and supplemental coolant additives (SCA's).

The following pages will give an explanation of water, antifreeze, and SCA's, and the correct way to mix them. They will also explain how to test antifreeze and SCA levels.

This section also contains information on cooling system maintenance and a coolant treatment chart that is used to determine the correct DCA4 service filters and liquid pre-charge.

Water Quality	
Calcium Magnesium (Hardness)	170 PPM as $(\text{CaCO}_3 + \text{MgCO}_3)$
Chloride	40 PPM as (Cl)
Sulfur	100 PPM as (SO_4)

Heavy Duty Coolant

Water

Water quality is important for cooling system performance. Excessive levels of calcium and magnesium contribute to scaling problems, and excessive levels of chlorides and sulfates cause cooling system corrosion.

Antifreeze

Cummins/Fleetguard® recommends using a low-silicate antifreeze concentrate that meets ASTM D4985 specifications (less than 0.10% silicate, expressed as Na_2SiO_3

Low-silicate antifreeze **must** be mixed with quality water at a 50/50 ratio (40 to 60% working range). A 50/50 mixture of antifreeze and water gives a -34°F freeze point and a boiling point of 228°F, which is adequate for locations in North America. The actual lowest freeze point of ethylene glycol antifreeze is at 68%. Using higher concentrations of antifreeze will raise the freeze point of the solution and increase the possibility of a silicate gel problem.

A refractometer **must** be used to accurately measure the freeze point of the coolant.

Do **not** use a floating ball hydrometer. Floating ball hydrometers will give incorrect readings.

Cooling System Sealing Additives

Do **not** use sealing additives in the cooling systems. The use of sealing additives will:

- Build up in coolant low flow areas.
- Clog coolant filters.
- Plug radiator and oil cooler.

Cooling System Soluble Oils

Do **not** use soluble oils in the cooling systems. The use of soluble oils will:

- allow cylinder liner pitting,
- corrode brass and copper,
- damage heat transfer surfaces, and
- damage seals and hoses

Supplemental Coolant Additives (SCA's)

Correct use of SCA's in conjunction with water and antifreeze are needed to protect engines from cooling system problems. The system **must** be pre-charged with the correct concentration of SCA.

Cummins/Fleetguard® uses the SCA unit to define the required concentration level to protect against liner pitting.

When coolant is replaced in the field, it **must** be replaced with **Heavy Duty Coolant** pre-charged with SCA's. In addition, a service coolant filter **must** be installed. Together, this will result in a total pre-charge of approximately 1.5 SCA units per gallon of coolant.

Coolant Blending/Mixing

Proper blending of **Heavy Duty Coolant** requires:

- Pour water into the container
- Add low-silicate antifreeze
- Add DCA4 liquid
- Thoroughly blend the components

Following the correct order for mixing the **Heavy Duty Coolant** will prevent additive dropout during the mixing process.

WHEN TESTED AT EVERY SUBSEQUENT OIL SERVICE INTERVAL

This chart, shown later in this document, **must** be followed to determine how much liquid SCA **must** be added to pre-charge different quantities of make-up coolant (water and low-silicate antifreeze). **Remember, a service filter must also be installed.**

In addition to using the chart as shown, the system requirements can be also calculated as shown in the following examples.

NOTE: It is important to know the cooling system capacity. If **not** sure of system capacity, contact the equipment OEM.

The following two examples illustrate how to calculate the required SCA quantity to add to the coolant to reach the desired concentration level.

When mixing 11 to 15 gallons of **Coolant**, 4 pints of DCA4 liquid **must** be added to obtain the correct SCA concentration level.

$$15 \text{ gallons} \times \frac{1.5 \text{ units}}{\text{gallon}} = 22.5 \text{ units}$$

$$22.5 \text{ units} \div \frac{5 \text{ units}}{\text{pint DCA4}} = 4.5 \text{ pints DCA4}$$

or approximately 4 pints of DCA4

For an 80-gallon system, three (3) gallons of DCA4 liquid **must** be added to pre-charge the coolant to the correct SCA concentration level.

Example:

$$80 \text{ gallons} \times \frac{1.5 \text{ units}}{\text{gallon}} = 120 \text{ units}$$

$$120 \text{ units} \div \frac{20 \text{ units}}{1/2 \text{ gallons DCA4}} = 6 \text{ half gallon containers of DCA4}$$

or 3 gallons of DCA4

6 to 10	2	2	4	4	4
11 to 15	2	4	4	6	8
16 to 20	2	4	6	8	12
	125	250	375	500	625
	Oil Drain Interval - Hours				

Notes:

- A. Consult the vehicle equipment manufacturer's maintenance information for total cooling system capacity.
- B. When draining and replacing the coolant, **always** pre-charge the cooling system to a SCA level of 1.5 units per gallon. This concentration level **must never** be allowed to go below 1.2 units and **must** be controlled when level is greater than 3 units. Action needed when level goes below 1.2 is a filter and liquid precharge; above 1.2 to 3.0 filter only; above 3.0, test and add filter when 3.0 and below.

NOTE: When performing service which requires draining the cooling system, take special precautions to collect it in a clean container, seal it to prevent contamination, and save for reuse.

- C. Change coolant filters at each oil change to protect the cooling system. The service filter listed above is satisfactory for use with maintenance intervals from 250 to 600 hours.

Caution: Under NO circumstances must a customer exceed one oil change interval before adding chemicals (by filter or liquid) to the coolant. If the recommended service intervals are neglected, there is a high probability that cylinder liner corrosion will occur.

Cooling System Maintenance

Supplemental Coolant Additives (DCA4), or equivalent, are required to protect the cooling system from fouling, solder blooming, and general corrosion. The cooling filter is required to protect the coolant system from abrasive materials, debris, and precipitated coolant additives.

NOTE: Cummins Engine Company requires that a service filter be used and SCA liquid added when the coolant is changed or a significant (more than 50 percent) coolant loss occurs. A service filter **must** be used during the normal oil change interval.

Diesel Coolant Additives (or equivalent) are used to prevent liner pitting, corrosion, and scale deposits in the cooling system.

After changing the coolant, the initial charge of DCA4 (or equivalent) concentration **must** be 1.5 unit per 3.8 liters [1 U.S. gallon] of coolant in the system.

NOTE: The cooling system **must** be clean before adding DCA4 (or equivalent).

The DCA4 concentration **must not** fall below 1.2 units or exceed 3 units per gallon of cooling system capacity.

If make-up coolant is added between intervals, additional DCA4 (or equivalent) will be required. Any coolant added **must** be pre-mixed with DCA4 to a concentration of 1.2 units per 3.8 liters [1 U.S. gallon] of coolant. With the service filter installed, the total system concentration **must** be 1.5 units DCA4 per gallon of coolant.

Caution: Insufficient concentration of the coolant additive will result in liner pitting and engine failure.

Use the correct Fleetguard® coolant filter to maintain the recommended DCA4 concentration in the system.

Maintain the correct concentration by changing the service coolant filter at each oil drain interval.

NOTE: The correct filter is determined by the total cooling system capacity and oil drain interval.

Testing SCA Concentration Level CC-2626 Test Kit

Carefully follow the instructions to test the coolant and take the appropriate action recommended by the kit.

Precautions:

DO

- Do** carry out testing in a well-lighted area.
- Do** make sure that hands are dry before removing strips from bottles.
- Do** allow coolant sample to reach room temperature for best results.
- Do** make sure that pad ends of strips are dipped.
- Do** replace and tighten caps on strip bottles to avoid getting moisture on strips.
- Do** make sure that all plastic containers are rinsed with water after each use to avoid contamination.

Don't

- Don't** handle pad ends of strip.
- Don't** allow pad ends of wet strips to touch during testing.
- Don't** get solution in eyes or on skin and clothing.
- Don't** allow contamination of the strips and solution bottles.
- Don't** allow contamination of the plastic containers during testing.
- Don't** use kits beyond expiration date.

Any variation to the technique listed below will give false readings resulting in incorrect service action.

Instructions For Proper Kit Use

1. Fill large plastic cup at least half full with coolant.
2. With syringe, draw coolant sample to the stop point and dispense into small plastic container.
3. Hold small plastic container at eye level and fill to the black line with Solution No. 1, then swirl to mix. (Note: Many coolants will become cloudy at this point which is normal.)
4. Dip strip A into solution for 1 to 2 seconds, remove and shake vigorously to remove excess coolant. This action is much like shaking down a thermometer. Lay strip A down on a clean surface and read after reading strip B.
5. Dip strip B into solution for 1 to 2 seconds, shake vigorously, wait 30 seconds and match to nearest color on the test kit chart within the next 30 seconds. If **not** sure of exact color, read to the left or lower concentration.
6. Read strip A the same as strip B.
7. Determine the intersecting block of strips A and B on the chart, and follow requirements listed above under Testing DCA4.
8. Clean all plastic containers by rinsing cups and filling or flushing syringe with tap water after each use.

When to Test

- When Not Sure of SCA Level
- Twice a Year
- When Over 3 Units Per Gallon of SCA

Test Intervals

Testing is recommended if the operator is **not** sure of the cooling system condition due to leaks, uncontrolled topping off of the system, or major coolant loss.

Testing is also recommended twice a year to monitor the SCA level. If the SCA level is above 3 units, test at subsequent oil drain intervals until the concentration is back under 3 units. When the concentration is back under 3 units, start installing service filters at each drain interval.

Below 1.2 Units

- Replace Service Filter
- Pre-charge With Liquid

If the concentration is below 1.2 units per gallon, replace the filter and pre-charge with liquid.

1.2 to 3 Units

- Replace Service Filter

If the concentration is 1.2 to 3 units per gallon, replace the filter.

Above 3 Units

- Do Not Replace Service Filter
- Test at Every Oil Change

If the concentration is above 3 units per gallon, do **not** replace the service filter. Test the coolant at subsequent oil drain intervals until the concentration is back under 3 units. When the concentration is back under 3 units, start installing service filters at each oil change interval.

NOTE: Do **not** utilize the test kit to maintain minimum SCA concentration levels (i.e., 1.5 units).

NOTE: In some instances, the A or B reading can be high. However, it is the combined reading that is important. **So, always follow the chart.**

The following coolant testing devices are available to assist in determining the condition of the coolant:

CC2626 Coolant Test Kit – Works with any SCA formulation (Call 1-800-521-4005 if you have this test kit and the color chart does not show the number of units of DCA per gallon of coolant. A new chart will be mailed to you. The new chart will allow you to use your existing test kit with the new service requirements detailed on the reverse side of this paper.)

Probalizer:

3318169S Plug – Installs on the engine for easy coolant sampling
3318168S Cap – Use with Monitor C bottle to sample coolant
CC2706 Monitor C – Lab analysis of coolant samples

Call the following numbers to get answers to any questions you may have about cooling system maintenance.

Cummins: 1-800-343-7357

Fleetguard: 1-800-521-4005

Drive Belt Tension Chart

To measure belt tension with a gauge, use the Belt Tension Chart to select the correct gauge for the belt width.

Belt Tension Specifications						
SAE Belt Size	Belt Tension Gauge Part No.		New Belt Installation Tension		*Used Belt Tension Limits

10 rib	3822525	3823138	1110	250	440 to 890	100-200
12 rib	3822525	3823138	1330	300	530 to 1070	120-240
16 rib L	N/A	3376344	2220	500	1110-2220	250-500
20 rib L	N/A	N/A	2670	600	1330-2670	300-600

* A belt is considered used if it has been in service for 10 minutes or longer.

* If used belt tension is less than the minimum value, tighten the belt to the maximum value.

Capscrew Markings and Torque Values

Caution: When replacing capscrews, always use a capscrew of the same measurement and strength as the capscrew being replaced. Using incorrect capscrews can result in engine damage.

SAE capscrews are graded according to the strength of the capscrew. They are marked on the head so the correct strength and torque are known.

The following examples indicate how capscrews are identified:

U.S. Customary [5/16 X 18 X 1-1/2]		
5/16	18	1-1/2
Major Thread Diameter in Inches	Number Threads per Inch	Length in Inches

NOTES:

1. **Always** use the torque values listed in the following table when specific torque values are **not** available.
2. Do **not** use the torque values in place of those specified in other sections of this manual. It is important to use the correct torque values for SAE grade 5 and 8 capscrews.
3. The torque values in the table are based on the use of lubricated threads.

Routine Service

Personnel at a Cummins Authorized Repair Location can assist you with the correct operation or service of your engine. We have a worldwide service network of more than 5,000 Cummins Distributors and Dealers who have been trained to provide sound advice, expert service, and complete parts support. Check the telephone directory yellow pages or refer to the directory in this section for the nearest Cummins Authorized Repair Location.

Emergency Service

The Cummins Customer Relations Department provides a 24-hour, toll free telephone number to aid in locating emergency service when a local Cummins Authorized Repair Location can **not** be reached. The emergency service telephone numbers are:

- United States and Canada (excluding Alaska and Hawaii)
 - (800) D-I-E-S-E-L-S
 - (800) 343-7357
- Outside of North America contact your Regional Office. Telephone numbers and addresses are listed in this section.

Problem Solving

Normally, any problem that arises with the sale, service, or repair of your engine can be handled by a Cummins Authorized Repair Location in your area. Refer to the telephone directory yellow pages for the one nearest you. If the problem has **not** been handled satisfactorily, follow the steps outlined below:

1. If the disagreement is with a Dealer, talk to the Cummins Distributor with whom he has his service agreement.
2. If the disagreement is with a Distributor, call the nearest Cummins Division or Regional Office; however, most problems are solved below the Division or Regional office level. Telephone numbers and addresses are listed in this section. Before calling, write down the following information:
 - a. Engine model and serial number
 - b. Type and make of equipment
 - c. Total kilometers [miles] or hours of operation
 - d. Warranty start date
 - e. Nature of problem
 - f. Summary of the current problem arranged in the order of occurrence
 - g. Name and location of the Cummins Distributor or Dealer
3. If a problem can **not** be resolved satisfactorily through your Cummins Authorized Repair Location or Division Office, write to:

Customer Relations - 41403, Cummins Engine Company, Inc., Box 3005, Columbus, IN 47202-3005

Worldwide Industrial and Marine

Engines Warranted

This warranty applies to new Engines sold by Cummins Engine Company, Inc., hereinafter 'Cummins', and delivered to the first user on or after June 1, 1993 that are used in generator drive application anywhere in the world where Cummins approved service is available. These Engines will have the following rating designations:

Standby Power Rating

Engines of this rating are applicable for supplying emergency power for the duration of the utility power outage. No overload capability is available for this rating. Under no condition is an Engine allowed to operate in parallel with the public utility at the Standby Power rating. This rating should be applied where reliable utility power is available. A standby rated engine is to be sized for a maximum of an 80 percent average load factor and 200 hours of operation per year. This includes less than 25 hours per year at the Standby Power rating. Standby rating should never be applied except in true emergency power outages. Negotiated power outages contracted with a utility company are not considered an emergency.

Unlimited Time Running Prime Power Rating

Engines with this rating are available for an unlimited number of hours per year in a variable load application. Variable load is not to exceed a 70 percent average of the Prime Power Rating during any operating period of 250 hours. Total operating time at 100 percent Prime Power shall not exceed 500 hours per year.

A 10 percent overload capability is available for a period of one hour within a twelve hour period of operation. Total operating time at the 10 percent overload power shall not exceed 25 hours per year.

Limited Time Running Prime Power Rating

Engines of this rating are available for a limited number of hours in a non-variable load application. It is intended for use in situations where power outages are contracted, such as in utility power curtailment. Engines may be operated in parallel to the public utility up to 750 hours per year at power levels never to exceed the Prime Power rating.

Limited Time Running Prime Power ratings differ from Unlimited Time Running in that even though the maximum power output of the engines are the same, the Limited Time Running allows the Engine to be parallel to Public Utility and run at the full Prime Power rating and must never exceed the Prime Power rating.

Continuous/Base Power Rating

Engines with this rating are available for supplying utility power at a constant 100 percent load for an unlimited number of hours per year. No overload capability is available for this rating.

Continuous/Base Power ratings differ from Unlimited Time Running Prime Power ratings in that the Continuous/Base Load ratings are significantly reduced from the Prime Power ratings. Continuous/Base Load ratings have no load factor or application restrictions.

Coverage

Base Engine Warranty

This warranty covers any failures of the Engine, under normal use and service, which result from a defect in material or workmanship (Warrantable Failure).

Coverage begins with the sale of the Engine by Cummins and continues for the Duration stated below. The Duration commences either on the date of delivery of the Engine to the first user, or on the date the Engine is first leased, rented or loaned, or when the Engine has been operated for 50 hours, whichever occurs first.

Base Engine Warranty		
Rating	Duration Whichever Occurs First	
	Months	Hours
Standby Power	24	400
Unlimited Prime Power	12	Unlimited
Limited Prime Power	12	750
Continuous/Base Power	12	Unlimited

Extended Major Components Warranty

The Extended Major Components Warranty applies to Engines other than B and C series and covers Warrantable Failures of the Engine cylinder block, camshaft, crankshaft and connecting rods (Covered Parts). Bushing and bearing failures are not covered. This coverage begins with the expiration of the Base Engine Warranty and continues for the Duration stated below. The Duration commences either on the date of delivery of the Engine to the first user, or on the date the Engine is first leased, rented or loaned, or when the Engine has been operated for 50 hours, whichever occurs first.

Extended Major Components Warranty		
Rating	Duration Whichever Occurs First	
	Months	Hours
Standby Power	36	600
Unlimited Prime Power	36	10,000
Limited Prime Power	36	2,250
Continuous/Base Power	36	10,000

Consumer Products

This warranty on Consumer Products in the United States is a LIMITED warranty. **CUMMINS IS NOT RESPONSIBLE FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES.** Any implied warranties applicable to Consumer Products terminate concurrently with the expiration of the express warranties applicable to the product. In the United States, some states do not allow the exclusion of incidental or consequential damages, or limitations on how long an implied warranty lasts, so the above limitations or exclusions may not apply to you.

These warranties are made to all Owners in the chain of distribution, and Coverage continues to all subsequent Owners until the end of the periods of Coverage.

Cummins Responsibilities

During Base Engine Warranty

Cummins will pay for all parts and labor needed to repair the damage to the Engine resulting from a Warrantable Failure, when performed during normal business hours. All labor costs will be paid in accordance with Cummins published Standard Repair Time guidelines.

Cummins will pay for the lubricating oil, antifreeze, filter elements, and other maintenance items that are not reusable due to the Warrantable Failure.

Cummins will pay reasonable travel expenses for mechanics to travel to and from the Engine site, including meals, mileage, and lodging when the repair is performed at the site of the failure.

Cummins will pay reasonable labor costs for Engine removal and reinstallation when necessary to repair a Warrantable Failure.

During the Extended Major Components Warranty

Cummins will pay for the repair or, at its option, replacement of the defective Covered Part and any Covered Part damaged by a Warrantable Failure of the defective Covered Part.

Owner's Responsibilities

During the Base Engine Warranty

Owner is responsible for the cost of lubricating oil, antifreeze, filter elements and other maintenance items replaced during warranty repairs unless such items are not reusable due to the Warrantable Failure.

During the Extended Major Components Warranty

Owner is responsible for the cost of all labor needed to repair the Engine, including the labor cost for Engine removal and reinstallation. When Cummins elects to repair a part instead of replacing it, the Owner is not responsible for the labor needed to repair the part.

Owner is responsible for the cost of all parts required for the repair except for the defective Covered Part and any Covered Part damaged by a Warrantable Failure of the defective Covered Part.

Owner is responsible for the cost of lubricating oil, antifreeze, filter elements and other maintenance items replaced during repair of a Warrantable Failure.

During the Base Engine and Extended Major Components Warranties

Owner is responsible for the operation and maintenance of the Engine as specified in the applicable Cummins Operation and Maintenance Manual. Owner is also responsible for providing proof that all recommended maintenance has been performed.

Before the expiration of the applicable warranty, Owner must notify a Cummins distributor, authorized dealer or other repair location approved by Cummins of any Warrantable Failure and make the Engine available for repair by such facility. Locations in the United States and Canada are listed in the Cummins United States and Canada Sales and Service Directory; other locations are listed in the Cummins International Sales and Service Directory.

Owner is responsible for communication expenses, meals, lodging and similar costs incurred as a result of a Warrantable Failure.

Owner is responsible for non-Engine repairs, "downtime" expenses, fines, all applicable taxes, all business costs and other losses resulting from a Warrantable Failure.

Owner is responsible for providing sufficient access to and reasonable ability to remove the Engine from the installation in the event of a Warrantable Failure.

Owner is responsible for maintaining an operating Engine hourmeter. If the hourmeter is not operational, engine usage will be estimated at 400 hours per month.

Limitations

Cummins is not responsible for failures or damage resulting from what Cummins determines to be abuse or neglect, including, but not limited to: operation without adequate coolants or lubricants; overfueling; overspeeding; lack of maintenance of lubricating, cooling or intake systems; improper storage, starting, warm-up, run-in or shutdown practices; unauthorized modifications to the Engine. Cummins is also not responsible for Engine performance problems or failures caused by incorrect oil or fuel, or by water, dirt or other contaminants in the fuel or oil.

This warranty does not apply to accessories supplied by Cummins which bear the name of another company. This category includes, but is not limited to: alternators, starters, fans, air conditioning compressors, clutches, filters, transmissions, air cleaners and safety shutdown switches.

Before a claim for excessive oil consumption will be considered, Owner must submit adequate documentation to show that consumption exceeds Cummins published standards.

Failure of belts and hoses supplied by Cummins are not covered beyond the first 500 hours or one year of operation, whichever occurs first after the warranty start date.

Parts used to repair a Warrantable Failure may be new Cummins parts, Cummins approved rebuilt parts, or repaired parts. Cummins is not responsible for failures resulting from the use of parts not approved by Cummins.

A new Cummins or Cummins-approved rebuilt part used to repair a Warrantable Failure assumes the identity of the part it replaced and is entitled to the remaining coverage hereunder.

Cummins is not responsible for Engine performance problems or failures resulting from:

1. Use or application of the Engine inconsistent with its rating designation as set forth above.
2. Inadequate or incorrect installations deviating from Cummins Generator Drive Installation Guidelines.

CUMMINS IS NOT RESPONSIBLE FOR WEAR OR WEAROUT OF COVERED PARTS.

CUMMINS IS NOT RESPONSIBLE FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES.

THE WARRANTIES SET FORTH HEREIN ARE THE SOLE WARRANTIES MADE BY CUMMINS IN REGARD TO THESE ENGINES. CUMMINS MAKES NO OTHER WARRANTIES, EXPRESS OR IMPLIED, OR OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

In the United States* and Canada, this warranty gives you specific legal rights, and you may also have other rights which vary from state to state.

Outside the United States* and Canada, in case of consumer sales, in some countries, the Owner has statutory rights which cannot be affected or limited by the terms of this warranty.

Nothing in this warranty excludes or restricts any contractual rights the owner may have against third parties.

*United States includes American Samoa, the Commonwealth of Northern Mariana Islands, Guam, Puerto Rico, and the U.S. Virgin Islands.

Worldwide Mobile Farming Equipment

Coverage

PRODUCTS WARRANTED

This warranty applies to new Engines sold by Cummins Engine Company, Inc., hereinafter 'Cummins', and delivered to the first user on or after February 1, 1993, that are used in industrial (off-highway) applications in the United States* and Canada, except for Engines used in marine, generator drive and certain defense applications, for which different warranty coverage is provided.

BASE ENGINE WARRANTY

This warranty covers any failures of the Engine, under normal use and service, which result from a defect in material or workmanship (Warrantable Failure).

Coverage begins with the sale of the Engine by Cummins. Coverage continues for two years or 2,000 hours of operation, whichever occurs first, from the date of delivery of the Engine to the first user, or from the date the unit is first leased, rented or loaned, or when the Engine has been operated for 50 hours, whichever occurs first. If the 2,000 hour limit is exceeded during the first year, coverage continues until the end of the first year.

EXTENDED MAJOR COMPONENTS WARRANTY

The Extended Major Components Warranty covers Warrantable Failures of the Engine cylinder block, camshaft, crankshaft and connecting rods (Covered Parts).

Bushing and bearing failures are not covered.

This coverage begins with the expiration of the Base Engine Warranty and ends after three years or 10,000 hours of operation, from the date of delivery of the Engine to the first user, or from the date the unit is first leased, rented or loaned, or from when the Engine has been operated for 50 hours, whichever occurs first.

CONSUMER PRODUCTS

The warranty on Consumer Products in the United States is a LIMITED warranty. **CUMMINS IS NOT RESPONSIBLE FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES.** Any implied warranties applicable to Consumer Products in the United States terminate concurrently with the expiration of the express warranties applicable to the product. In the United States, some states do not allow the exclusion of incidental or consequential damages, or limitations on how long an implied warranty lasts, so the above limitations or exclusions may not apply to you.

These warranties are made to all Owners in the chain of distribution, and Coverage continues to all subsequent Owners until the end of the periods of Coverage.

Cummins Responsibilities

DURING THE BASE ENGINE WARRANTY

Cummins will pay for all parts and labor needed to repair the damage to the Engine resulting from a Warrantable Failure.

Cummins will pay for the lubricating oil, antifreeze, filter elements, and other maintenance items that are not reusable due to the Warrantable Failure.

Cummins will pay reasonable costs for mechanics to travel to and from the equipment site, including meals, mileage and lodging, when the repair is performed at the site of the failure.

Cummins will pay reasonable labor costs for Engine removal and reinstallation when necessary to repair a Warrantable Failure.

DURING THE EXTENDED MAJOR COMPONENTS WARRANTY

Cummins will pay for the repair or, at its option, replacement of the defective Covered Part and any Covered Part damaged by a Warrantable Failure of the defective Covered part.

Owners Responsibilities

DURING THE BASE ENGINE WARRANTY

Owner is responsible for the cost of lubricating oil, antifreeze, filter elements and other maintenance items provided during warranty repairs unless such items are not reusable due to the Warrantable Failure.

DURING THE EXTENDED MAJOR COMPONENTS WARRANTY

Owner is responsible for the cost of all labor needed to repair the Engine, including the labor to remove and reinstall the Engine. When Cummins elects to repair a part instead of replacing it, Owner is not responsible for the labor needed to repair the part.

Owner is responsible for the cost of all parts required for the repair except for the defective Covered Part and any Covered Part damaged by a Warrantable Failure of the defective Covered Part.

Owner is responsible for the cost of lubricating oil, antifreeze, filter elements and other maintenance items replaced during repair of a Warrantable Failure.

DURING THE BASE ENGINE AND EXTENDED MAJOR COMPONENTS WARRANTIES

Owner is responsible for the operation and maintenance of the Engine as specified in the applicable Cummins Operation and Maintenance Manual. Owner is also responsible for providing proof that all recommended maintenance has been performed.

Before the expiration of the applicable warranty, Owner must notify a Cummins distributor, authorized dealer or other repair location approved by Cummins of any Warrantable Failure and make the Engine available for repair by such facility. Locations in the United States and Canada are listed in the Cummins Off Highway Authorized Dealer Directory.

Owner is responsible for communication expenses, meals, lodging and similar costs incurred as a result of a Warrantable Failure.

Owner is responsible for non-Engine repairs, "downtime" expenses, cargo damage, fines, all applicable taxes, all business costs and other losses resulting from a Warrantable Failure.

Limitations

Cummins is not responsible for failures or damage resulting from what Cummins determines to be abuse or neglect, including, but not limited to: operation without adequate coolants or lubricants; overfueling; overspeeding; lack of maintenance of lubricating, cooling or intake systems; improper storage, starting, warm-up, run-in or shutdown practices; unauthorized modifications of the Engine. Cummins is also not responsible for failures caused by incorrect oil or fuel or by water, dirt or other contaminants in the fuel or oil.

For power units and fire pumps (package units), this warranty applies to accessories, except for clutches and filters, supplied by Cummins which bear the name of another company.

Except for power units and fire pumps, this warranty does not apply to accessories which bear the name of another company. This category includes, but is not limited to: alternators, starters, fans, air conditioning compressors, clutches, filters, transmissions, torque converters, steering pumps, and non-Cummins fan drives, engine compression brakes and air compressors.

Cummins Compusave units are covered by a separate warranty.

Before a claim for excessive oil consumption will be considered, Owner must submit adequate documentation to show that consumption exceeds Cummins published standards.

Failures of belts and hoses supplied by Cummins are not covered beyond the first 500 hours or one year of operation, whichever occurs first.

Parts used to repair a Warrantable Failure may be new Cummins parts, Cummins approved rebuilt parts, or repaired parts. Cummins is not responsible for failures resulting from the use of parts not approved by Cummins.

A new Cummins or Cummins-approved rebuilt part used to repair a Warrantable Failure assumes the identity of the part it replaced and is entitled to the remaining coverage hereunder.

CUMMINS DOES NOT COVER WEAR OR WEAROUT OF COVERED PARTS.

CUMMINS IS NOT RESPONSIBLE FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES.

THESE WARRANTIES SET FORTH HEREIN ARE THE SOLE WARRANTIES MADE BY CUMMINS IN REGARD TO THESE ENGINES. CUMMINS MAKES NO OTHER WARRANTIES, EXPRESS OR IMPLIED, OR OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

This warranty gives you specific legal rights, and you may also have other rights which vary from state to state.

* United States includes American Samoa, the Commonwealth of Northern Mariana Islands, Guam, Puerto Rico and the U.S. Virgin Islands.

International Industrial

Coverage

PRODUCTS WARRANTED

This warranty applies to new Engines sold by Cummins Engine Company, Inc., hereinafter 'Cummins', and delivered to the first user on or after February 1, 1993, that are used in industrial (off-highway) applications anywhere in the world where Cummins-approved service is available, except the United States* and Canada. Different warranty coverage is provided for Engines used in marine, generator drive and certain defense applications.

BASE ENGINE WARRANTY

This warranty covers any failures of the Engine, under normal use and service, which result from a defect in material or workmanship (Warrantable Failure).

Coverage begins with the sale of the Engine by Cummins. Coverage continues for two years or 2,000 hours of operation, whichever occurs first, from the date of delivery of the Engine to the first user, or from the date the unit is first leased, rented or loaned, or when the Engine has been operated for 50 hours, whichever occurs first. If the 2,000 hour limit is exceeded during the first year, coverage continues until the end of the first year.

EXTENDED MAJOR COMPONENTS WARRANTY

The Extended Major Components Warranty covers Warrantable Failures of the Engine cylinder block, camshaft, crankshaft and connecting rods (Covered Parts).

Bushing and bearing failures are not covered.

This coverage begins with the expiration of the Base Engine Warranty and ends three years or 10,000 hours of operation, after the date of delivery of the Engine to the first user, or from the date the unit is first leased, rented or loaned, or from when the Engine has been operated for 50 hours, whichever occurs first.

These warranties are made to all Owners in the chain of distribution, and Coverage continues to all subsequent Owners until the end of the periods of Coverage.

Cummins Responsibilities

DURING THE BASE ENGINE WARRANTY

Cummins will pay for all parts and labor needed to repair the damage to the Engine resulting from a Warrantable Failure.

Cummins will pay for the lubricating oil, antifreeze, filter elements, and other maintenance items that are not reusable due to a Warrantable Failure.

Cummins will pay reasonable costs for mechanics to travel to and from the equipment site, including meals, mileage and lodging, when the repair is performed at the site of the failure.

Cummins will pay reasonable labor costs for Engine removal and reinstallation when necessary to repair a Warrantable Failure.

DURING THE EXTENDED MAJOR COMPONENTS WARRANTY

Cummins will pay for the repair or, at its option, replacement of the defective Covered Part and any Covered Part damaged by a Warrantable Failure of the defective Covered part.

Owners Responsibilities

DURING THE BASE ENGINE WARRANTY

Owner is responsible for the cost of lubricating oil, antifreeze, filter elements and other maintenance items replaced during warranty repairs unless such items are not reusable due to the Warrantable Failure.

DURING THE EXTENDED MAJOR COMPONENTS WARRANTY

Owner is responsible for the cost of all labor needed to repair the Engine, including the labor to remove and reinstall the Engine. When Cummins elects to repair a part instead of replacing it, Owner is not responsible for the labor needed to repair the part.

Owner is responsible for the cost of all parts required for the repair except for the defective Covered Part and any Covered Part damaged by a Warrantable Failure of the defective Covered Part.

Owner is responsible for the cost of lubricating oil, antifreeze, filter elements and other maintenance items replaced during repair of a Warrantable Failure.

DURING THE BASE ENGINE AND EXTENDED MAJOR COMPONENTS WARRANTIES

Owner is responsible for the operation and maintenance of the Engine as specified in the applicable Cummins Operation and Maintenance Manual. Owner is also responsible for providing proof that all recommended maintenance has been performed.

Before the expiration of the applicable warranty, Owner must notify a Cummins distributor, authorized dealer or other repair location approved by Cummins of any Warrantable Failure and make the product available for repair by such facility. Locations are listed in the Cummins International Sales and Service Directory.

Owner is responsible for communication expenses, meals, lodging and similar costs incurred as a result of a Warrantable Failure.

Owner is responsible for non-Engine repairs, "downtime" expenses, cargo damage, fines, all applicable taxes, all business costs and other losses resulting from a Warrantable Failure.

Limitations

Cummins is not responsible for failures or damage resulting from what Cummins determines to be abuse or neglect, including, but not limited to: operation without adequate coolants or lubricants; overfueling; overspeeding; lack of maintenance of lubricating, cooling or intake systems; improper storage, starting, warm-up, run-in or shutdown practices; unauthorized modifications of the Engine. Cummins is also not responsible for failures caused by incorrect oil or fuel or by water, dirt or other contaminants in the fuel or oil.

With certain exceptions, this warranty does not apply to accessories supplied by Cummins which bear the name of another company. The exceptions to which this warranty does apply are:

1. Accessories, except for clutches and filters, supplied by Cummins as part of a fire pump or power unit (package units) are covered for the duration of Base Engine Warranty.
2. Starters, alternators, power steering pumps and non-Cummins air compressors supplied by Cummins on B or C Series Engines in applications other than fire pumps or power units are covered for six months.

Examples of accessories to which this warranty does not apply are: air conditioning compressors, clutches, air cleaners, fans, filters, transmissions and torque convertors.

Cummins Compusave units are covered by a separate warranty.

Before a claim for excessive oil consumption will be considered, Owner must submit adequate documentation to show that consumption exceeds Cummins published standards.

Failures of belts and hoses supplied by Cummins are not covered beyond the first 500 hours or one year of operation, whichever occurs first.

Parts used to repair a Warrantable Failure may be new Cummins parts, Cummins approved rebuilt parts, or repaired parts. Cummins is not responsible for failures resulting from the use of parts not approved by Cummins.

A new Cummins or Cummins-approved rebuilt part used to repair a Warrantable Failure assumes the identity of the part it replaced and is entitled to the remaining coverage hereunder.

CUMMINS DOES NOT COVER WEAR OR WEAROUT OF COVERED PARTS.

CUMMINS IS NOT RESPONSIBLE FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES.

THESE WARRANTIES SET FORTH HEREIN ARE THE SOLE WARRANTIES MADE BY CUMMINS IN REGARD TO THESE ENGINES. CUMMINS MAKES NO OTHER WARRANTIES, EXPRESS OR IMPLIED, OR OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

In case of consumer sales, in some countries, the Owner has statutory rights which cannot be affected or limited by the terms of this warranty.

Nothing in this warranty excludes or restricts any contractual rights the Owner may have against third parties.

* United States includes American Samoa, the Commonwealth of Northern Mariana Islands, Guam, Puerto Rico and the U.S. Virgin Islands.

This image shows a full page of blank, lined paper. It features approximately 20 evenly spaced horizontal black lines running across the width of the page, typical of notebook or legal stationery. The background is a solid off-white color. There are no margins, text, or other markings present.

This image shows a single sheet of white paper with horizontal ruling lines. The lines are evenly spaced and run across the width of the page. There are no margins, text, or other markings on the paper.

This image shows a single sheet of white paper with horizontal ruling lines. The lines are evenly spaced and run across the width of the page. There are no margins, text, or other markings on the paper.

NOTES

This image shows a single sheet of white paper with horizontal ruling lines. The lines are evenly spaced and run across the width of the page. There are no margins, text, or other markings on the paper.

Cummins Customized Parts Catalog

Cummins is pleased to announce the availability of a parts catalog compiled specifically for you. Unlike the generic versions of parts catalogs that support general high volume parts content; Cummins Customized catalogs contains only the new factory parts that were used to build your engine.

The catalog cover, as well as the content, is customized with you in mind. You can use it in your shop, at your worksite, or as a coffee table book in your RV or boat. The cover contains your name, company name, address, and telephone number. Your name and engine model identification even appears on the catalog spine. Everybody will know that Cummins created a catalog specifically for you.

This new catalog was designed to provide you with the exact information you need to order parts for your engine. This will be valuable for customers that do not have easy access to the Cummins Electronic Parts Catalog or the Cummins Parts Microfilm System.

Additional Features of the Customized Catalog include:

- Engine Configuration Data
- Table of Contents
- Separate Option and Parts Indexes
- Service Kits (when applicable)
- ReCon Part Numbers (when applicable)

ORDERING THE CUSTOMIZED PARTS CATALOG

Customers can call Gannett Marketing Services at 1-800-646-5609 and order by credit card. Ask for bulletin 3672139 the Customized Parts Catalog. North American customers can mail in the attached postage pre-paid order card.

ATTENTION: INTERNATIONAL CUSTOMERS (outside U.S.A.) insert the completed Customized Catalog order form in an envelope and mail to the address printed on the order form. Or, use the E-mail address **catalog@gdms.com** to place an order for a Customized Parts Catalog.

Contact GDMS for the current price; Freight will be an additional expense.

This information is required to provide a Customized Parts Catalog:

- Name
- Street Address
- Company Name (optional)
- Telephone no.
- Credit Card No.
- Cummins Engine Serial Number (located on the engine dataplate)

Unfortunately not all Cummins Engines can be supported by this parts catalog. Engines older than 1984 or newer than 3 months may not have the necessary parts information to compile a catalog. We will contact you if this occurs and explain why we are unable to fill your order.

Customized Parts Catalogs are produced specifically for a single customer. This means they are not returnable for a refund. If we make an error and your catalog is not useable, we will correct that error by sending you a new catalog.

NO POSTAGE
NECESSARY
IF MAILED
IN THE
UNITED STATES

Literature Survey Form

Bulletin No. 3666002-02 by Dept. 6750

We are always open to any suggestions or recommendations that will aid in improving our manuals. Use this postage paid survey form to evaluate this manual. Please check the appropriate response and use the space provided below to list any additional comments:

	Yes	No
Is the needed information easy to locate in the manual?	_____	_____
Is the information easy to read?	_____	_____
Is the information easy to understand?	_____	_____
Does the information sufficiently cover the subject?	_____	_____
Are subjects in the Index specific enough to locate in the manual?	_____	_____
Are the important points sufficiently emphasized?	_____	_____
Are the illustrations easy to understand?	_____	_____
Does the text support the operation being illustrated?	_____	_____
Do you use the Table of Contents?	_____	_____
Do you use the Index?	_____	_____

What feature(s) of the manual do you like? _____

What feature(s) of the manual don't you like? _____

What additional information should the manual include? _____

Please comment on any response(s) marked "No" in this survey. _____

Other comments that you feel would help improve the manual? _____

Please fold and staple
